VHF FM Crystal TX RX**

TRANSMITTER EXCITER SIDE

RECEIVER SIDE

ELECTRICAL PERFORMANCE

ZYCOMM
FM 25-12
VHF

GENERAL

Frequency..... 12 assigned spot frequencies between 134-174 MHz (space between F1 and F12 should be 500 KHz or less)
Communications System..... Press to talk
Type of Emission..... F3 (phase modulation) ± 2.5 KHz
Microphone..... Dynamic, 600 ohms
Output Impedance..... 50 ohms
Power Source..... DC 13.8 V (directly)
AC 240 V (with rectified power supply)
Power Consumption (13.6 V DC Input).....
25 watt RF output; 4.5 A

Operating Conditions:

Ambient Temperature..... -10°C to +55°C
Relative Humidity..... +40°C, 95% or less
Power Source Variation... 13.8V $\pm 10\%$ or less

Dimensions and Weight:

Dimensions..... 174m/m (6.85 in.) Wide *
54m/m (2.13 in.) High *
225m/m (8.86 in.) Deep
Weight..... 2.5 kgs. (5.51 lbs.)

Approval..... To Home Office, M.P.T. 1301

TRANSMITTER

Frequency Stability..... $\pm 0.0005\%$
(-10°C to +55°C)
Frequency Multiplication..... 18 times (3x3x2)
Rated RF Output..... 25 watts
Harmonics and Spurious Emission
..... At 25 watts RF output; 70 dB
or more below carrier level

RECEIVER

Frequency Stability..... $\pm 0.0005\%$ or better
(10°C to +55°C) -
Receiver Type..... Double Superheterodyne
Local Oscillator Frequency...(RX Freq.-16.9)/3
Intermediate Frequencies..... 16.9 MHz. 1st IF
455 KHz. 2nd
Sensitivity..... 0.5 uV or better for 20 dB quieting
Selectivity..... 85 dB or more down at adjacent channel
Spurious Sensitivity..... -80 dB or better
Squelch Sensitivity..... 0.3 uV or better
A. F. Output..... 2.0 watts or more
(10% distortion)

TRANSMITTER CIRCUIT DESCRIPTION

The transmitter circuit consists of a modified Sabaroff type crystal controlled oscillator, buffer amplifier, modulator, frequency multiplier ($3 \times 3 \times 2$), amplifier, exciter and power amplifier.

1. Oscillator

To minimize the frequency drift against fluctuations of ambient temperature, a modified Sabaroff type crystal controlled oscillator circuit (Q101) is provided. Capacitors C101–C112 (40pF) and C115 (180pF) are utilized to provide thermal compensation. To prevent fluctuation of oscillator frequency due to changes in source voltage, a voltage regulator is used. The crystal used is HC-25/U. Trimmers VC101-VC112 are provided for adjusting the oscillator frequency. The oscillator frequency is 1/18 of the transmitting frequency.

2. Buffer Amplifier

Q102 and associated components form the buffer stage. It is placed between the oscillator and modulator circuits to prevent interaction between the two circuits. Q104 stabilizes the modulator stage.

3. Modulator

Q103 and associated components provide the phase modulation by vector sum.

4. Frequency Multiplier

The modulated and amplified signal frequency is multiplied up to the transmitting frequency through 3 stages.

1st – Q105 — Tripler

2nd – Q106 — Tripler

3rd – Q107 — Doubler

In these stages, high Q double tuned circuits are employ-

ed to prevent excess unwanted spurious emission. The output from these stages is delivered to the next amplified.

5. Pre-Driver

Q108 and Q109 work as the amplifier. The signal delivered from the frequency multiplier is amplified up to a level which is sufficient to drive the power amplifier.

6. Power Amplifier

1 The signal delivered from the driver stage is amplified by power amplifier Q210. Output (25W) is delivered to the antenna connector through a switching circuit and low pass filter (Q9 and associated circuitry).

7. Modulator Amplifier

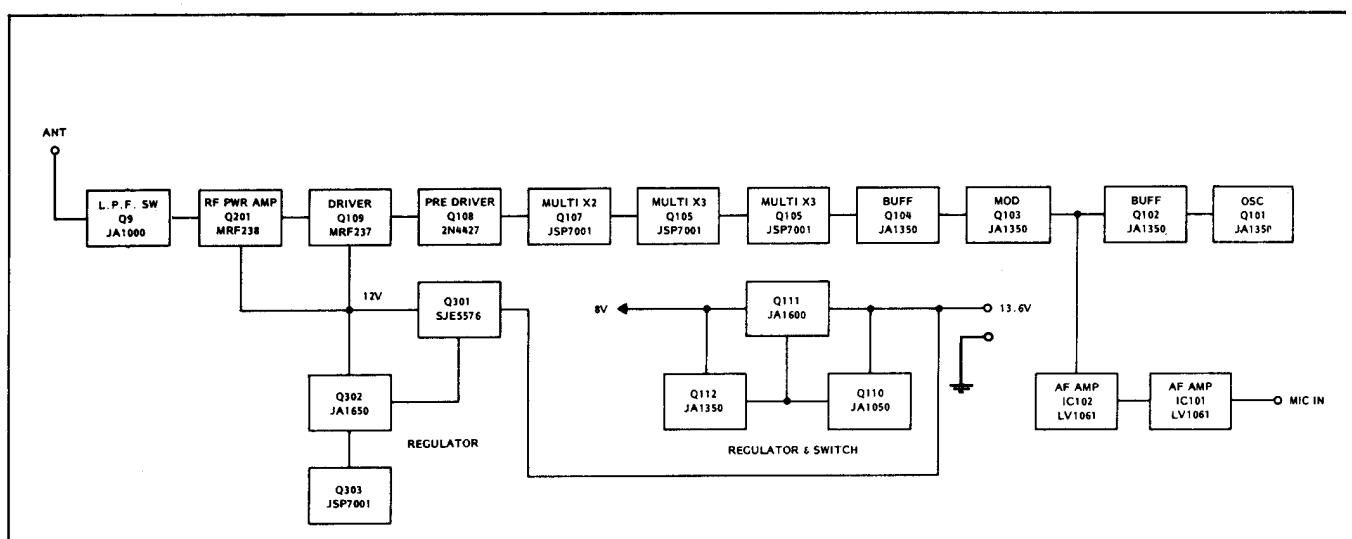

The input signal from the microphone is amplified by IC101 and delivered to the IDC (instant deviation control) circuit where the AF signal is clipped. The AF signal is further amplified by IC102 and coupled to the modulator transistor Q103. The modulation level is adjusted by VR101. The audio frequency response is improved by L106, C167-C170.

8. Voltage Regulator (for Transmitter and P.A. stage)

A voltage regulator circuit, consisting of Q110, Q111, Q112, D105 and associated components, is provided to supply a stabilized 8V source voltage to the transmitter stages regardless of input voltage variations.

9. Voltage Regulator (for RF Amplifiers)

This circuit consists of Q301, Q302, Q303, D301 and other components, and provides stabilized 12V to the driver and power amplifier stages.

RECEIVER CIRCUIT DESCRIPTION

The receiver is a double superheterodyne circuit consisting of RF amplifier, 1st Mixer, 1st IF Filter, 1st IF Amplifier, 2nd Mixer, 2nd IF Filter, 2nd IF Amplifier, Amplitude clipper, Discriminator and AF Amplifier.

In addition, there are two local oscillator circuits, squelch circuit, and voltage regulator.

1. RF Amplifier

The RF amplifier is made up of Q1 and amplifies the received signal. The spurious radiation from the 1st local oscillator is also sufficiently suppressed in this stage.

2. 1st Mixer

Dual gate field effect transistor Q2 is used in this stage for best intermodulation performance.

The received signal is converted into the 1st intermediate frequency of 16.9 MHz. in this stage.

3. 1st Local Oscillator

The 1st local oscillator circuit is made up of oscillator Q5, buffer amplifier Q6 and frequency tripler Q7. A "Hartley" type oscillator circuit is used for third overtone oscillation.

The receiving frequency of the crystal is (Freq. - 16.9 MHz.) \div 3. The supply voltage for the oscillator circuit is regulated through the voltage regulator circuit consisting of Q10 and Q11. Temperature-compensated capacitor, C52 (40pF) provides frequency stability against temperature variations. The signal from the oscillator is amplified by Q6 and frequency multiplied by Q7. The output of the local oscillator is applied to the collector of 1st mixer transistor Q2.

4. 1st IF Amplifier

Represented by IC1. The filtered 16.9 MHz. signal is amplified in this stage.

5. 2nd Local Oscillator

The 2nd local oscillator is Q8. The oscillation frequency is 16.445 MHz.

A pierce type oscillator circuit with temperature compensating capacitor C70 providing good frequency stability against temperature variations.

6. 2nd IF Amplifier

The 2nd IF amplifier consists of amplifier of IC2, IC3 and amplitude clipper Q4. The 455 KHz. IF signal from the 2nd mixer is further amplified in this stage and the amplitude modulation factor is eliminated by the clipper circuit.

7. Discriminator

L8, DIS, D3, D4 and associated components form the discriminator circuit. The frequency modulated information in the received signal is detected and converted into the audio signal in this stage.

8. AF Amplifier

The detected signal is amplified to drive the speaker. The AF amplifier provides maximum output of approximately 2 watts into 8Ω .

9. Squelch Circuit

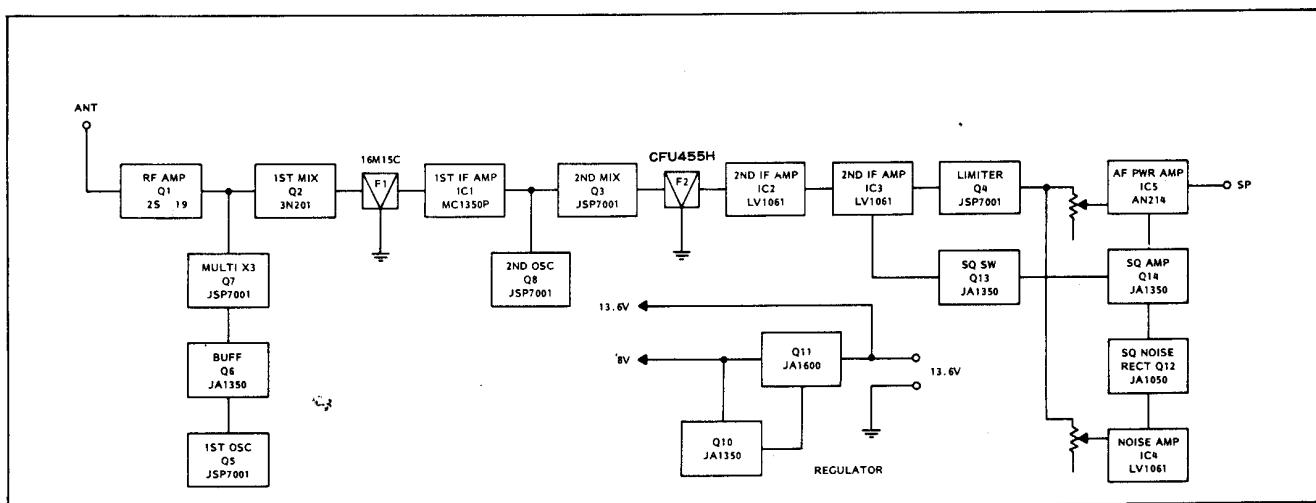

To ensure reliable operation of the squelch control, the signal which initiates operation of the squelch circuit, is picked up at two points. One is derived from the 2nd IF amplifier through rectifiers D1 and D2 and applied to DC amplifier Q13. The other is picked up at the discriminator output. The noise components from the discriminator are amplified through IC4 and then applied to rectifier/amplifier Q12. The signals from Q12 and Q13 are mixed in Q14 for switching AF amplifier IC5. The squelch level is controlled by VR2. Maximum squelch level (Fully clockwise position) is adjusted by VR3, the factory adjustment has been done at the antenna input of 3-4 micro volt.

10. Voltage Regulator (including Push-to-Talk circuit)

The voltage regulator circuit consisting of Q10, Q11, D5 and associated components, is arranged to supply stabilized 8V source to the +B line. This eliminates unwanted variations caused by voltage changes.

11. Antenna Switching

Q9 (JA1000) activates the antenna switching diodes D203 and D204 (IS954 for transmitting or receiving mode).

ALIGNMENT AND ADJUSTMENT – TRANSMITTER SECTION

13.6V. J1

Stage	Adjusting Point	Measuring Point	Alignment and Adjustment	Measuring Instruments
1 Regulator	VR102	Q111 Emitter	Connect the power meter to the output terminal of driver stage terminal. Measure the voltage of Q111 emitter, then rotate the semi-fixed variable resistor (VR102) so that the voltage goes to 8V.	VOM Power Meter (50Ω) Screw Driver
2 Oscillator	None	CP-101	Connect a vom to the check point CP-101, confirm the voltage is in oscillating condition on each channel. Normal voltage is; No Osc = approx. 1.5 – 1.6 DC Oscillating = approx. 1.6 – 1.7V DC	VOM
3. Multiplier a)	L101	CP-101	Set channel switch to A. Connect a VOM to check point CP-101, adjust the core of L101 for maximum indication on meter. Standard voltage = approx. 0.8V DC	VOM power meter 50Ω
b) b)	L102 L102	CP-101 CP-101	Adjust the core of L102 for minimum voltage at CP-101.	Screw Driver
c)	L102 L103	CP-102	Connect the VOM to check point CP-102, adjust L103 and L102. For maximum indication on VOM. Repeat this adjustment two or three times. Standard voltage = approx. 1.57V DC	
d)	L104	CP-102	Adjust the coil L104 for minimum voltage at CP-102.	
e)	L104	CP-103	Connect the VOM to check point CP-103, adjust coil L104 and L105 for maximum voltage at CP-103.	
f)	VC113	CP-103	Adjust the semi-fixed capacitor VC113 for minimum voltage at CP-103.	
4 RF Amplifier	VC115 VC116 VC117 VC118 VC119	Power Meter	Adjust each semi-fixed capacitor VC115, VC116, VC117, VC118 and VC119 for maximum indication on power meter. This adjustment should be repeated several times until the power meter indicates 3W or more. Current flow is 200–300mA in this case. After finishing these adjustments, connect the RF output terminal of the exciter stage to the final and remove the power meter.	RF Power Meter (50Ω) Screw Driver
5 RF Power Amplifier High Power	VC201 VC202 VC203 S3 VC204 High	Power Meter	Connect a 30-watt Power Meter to J-2. Adjust VC201, VC202, VC203 and VC204 for maximum reading. Normal reading is approx. 20 – 25 watts.	RF Power Meter (30W, 50Ω)
6 Freq. Adjustment	VC101 to VC112	Coupling Attenuator	Emission frequency can be adjusted by VC101 – VC112. Frequency deflection at standard condition should be within ±0.0005%.	Freq. Counter Screw Driver Power Meter
7 Modulation	VR101		Connect Audio Frequency Generator to the Mike Terminal (J3) and apply audio frequency level of –20dBm/600Ω at 1,000 Hz. Adjust the semi-fixed resistor VR-101 for a deviation of 2.2KHz ±0.2KHz.	AF. Oscillator Power Meter (30W, 50Ω)

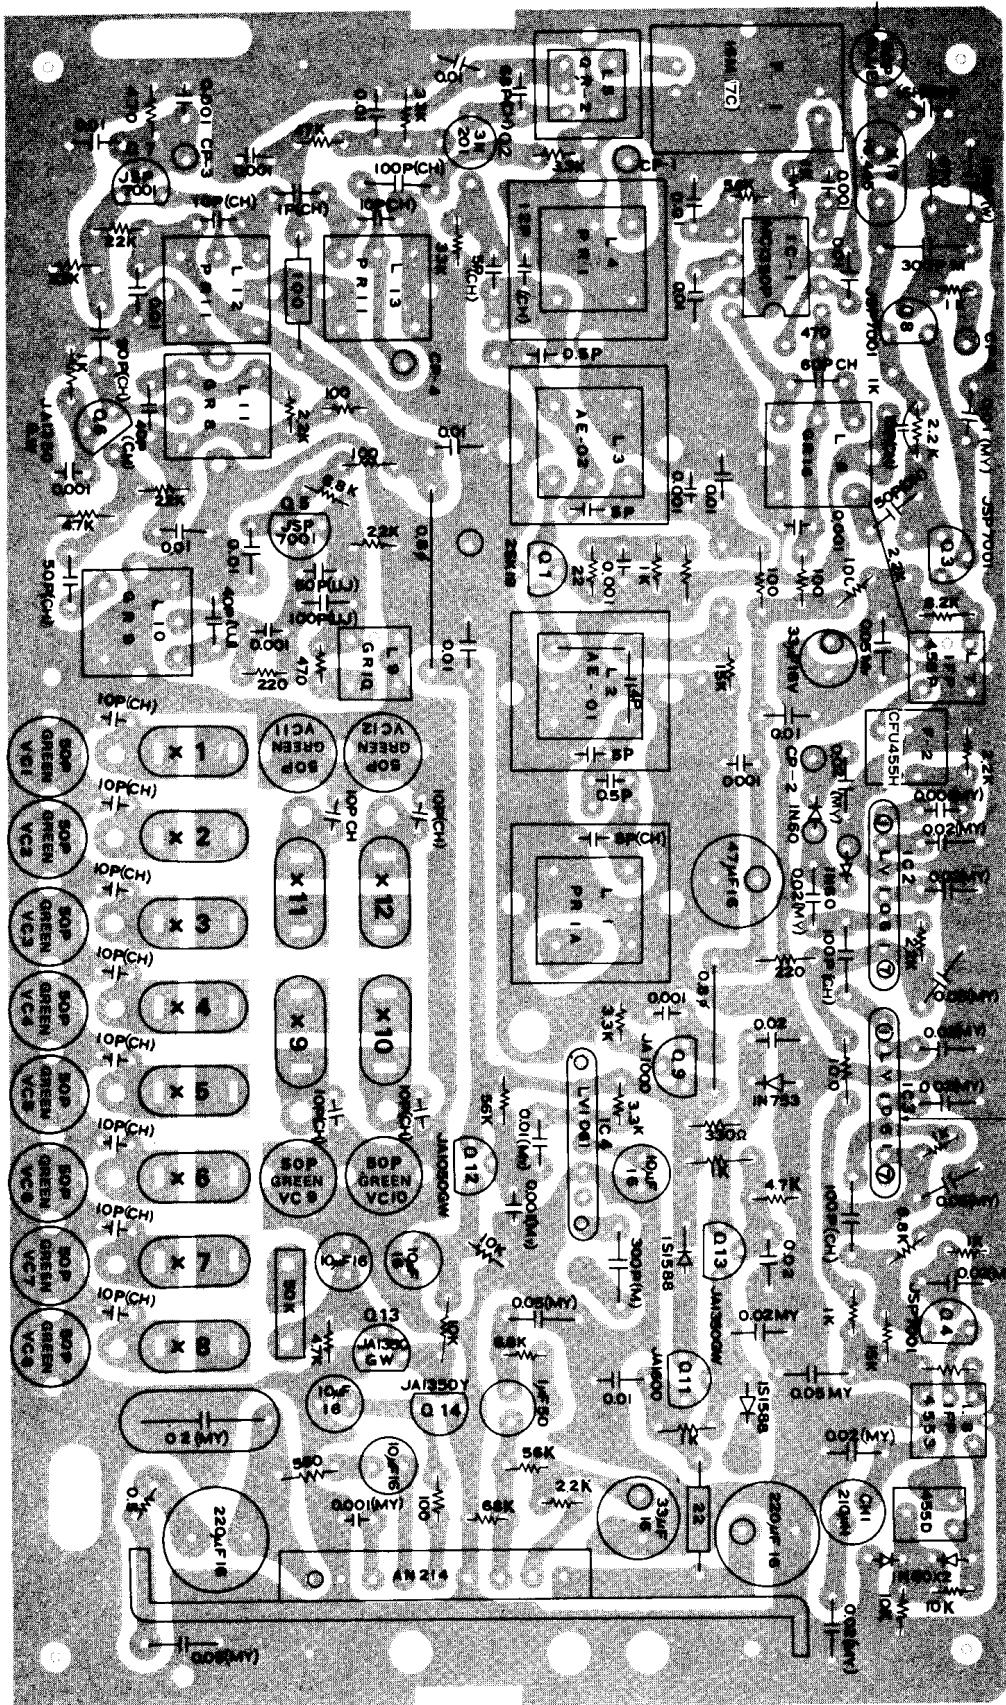

ALIGNMENT AND ADJUSTMENT – RECEIVER SECTION

Stage	Adjusting Point	Measuring Point	Alignment and Adjustment	Measuring Instruments
1 AF Amplifier	None	Speaker terminal	Connect an Audio Frequency Generator to the center pin of AF volume control, then inject 50mV at 1 KHz. If the audio amplifier has no trouble, the voltage across speaker terminal will appear more than 3V (1W). Also observe the wave form for distortion by using an oscilloscope.	AF Generator Speaker 8Ω V.T.V.M. Oscilloscope
2 2nd Local Oscillator	VC13	CP-5	Connect a frequency counter to check point CP-5. Adjust trimmer capacitor VC13 so that the frequency obtained is 16.445 MHz.	Frequency
3 1st Local Oscillator	L10	CP-3	Connect the VOM to check point CP-3, select the channel with the highest frequency. Adjust the core of L10 from the end of minimum inductance until the voltage at CP-3 goes up suddenly. This means Oscillation has begun at this point. Normal reading is approximately 0.7V to 1V. Then, the core of L10 should be fixed at the point which is two additional clock-wise turns from the oscillating point.	VOM Freq. Counter
	L11	CP-3	Next, adjust the coil L11, so that the voltage of CP-3 will be at the same level at any channel between highest and lowest frequency.	
	VC1 thru VC12	CP-4	Connect a frequency counter to check point CP-4, adjust the oscillating frequency or each crystal by adjusting its associated variable capacitor VC1 thru VC12. Oscillation frequency is; Receiving frequency minus 16.9 MHz.	MHz mHz
4. RF Amplifier	L1 L2 L3 L4	CP1	Connect a sweep generator to the antenna terminal and check point CP1. Adjust L1, L2, L3 and L4 so that the scope pattern is identical to figure 1.	Sweep Generator Oscilloscope
5 Overall Adjustment	L12 L13 L5 L6 L7	CP-2 Speaker	Feed an RF signal to the antenna terminal at the selected channel frequency and adjust the frequency of SSG so that the noise level from the speaker terminal will be minimum or the voltage of CP-2 will reach maximum.	V.T.V.M. SSG Oscilloscope Tester
	L8	Speaker	Next, adjust the coil L12, L13, L5, L6 and L7 so that the voltage at check point CP-2 is maximum. Normal reading is approx. 0.5–1V. When the speaker noise level is preferred for adjustment, adjust the above coils so that the noise level from the speaker terminal will be reduced.	
6 Squelch	None	Speaker	Next, feed the modulated RF signal (1 KHz ± 2.0 KHz. dev.) to the antenna terminal and adjust coil L8 for maximum AF output.

ADDING NEW CHANNELS

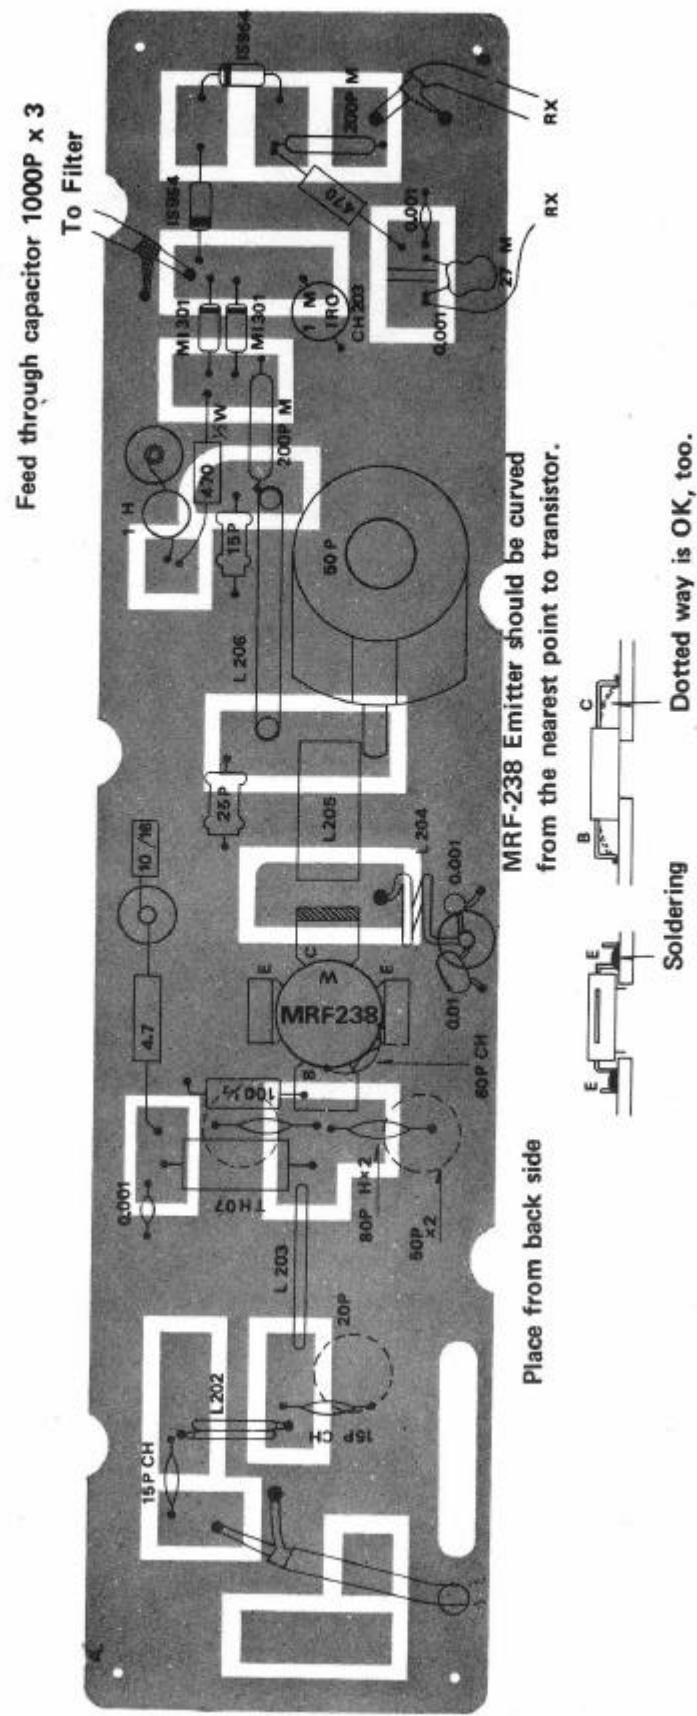

When adding new crystals, Receive and Transmit crystal frequency can be calculated from the following formula :

- | | |
|---------------|-----------------------------------|
| ① Lodging Cap | R _x = Series Resonance |
| | T _x = 50.6p~51p |
| ② Co | 5 pF max |
| ③ Tolerance | 0.0005 % |
| ④ Drive level | 1 mW or Less |

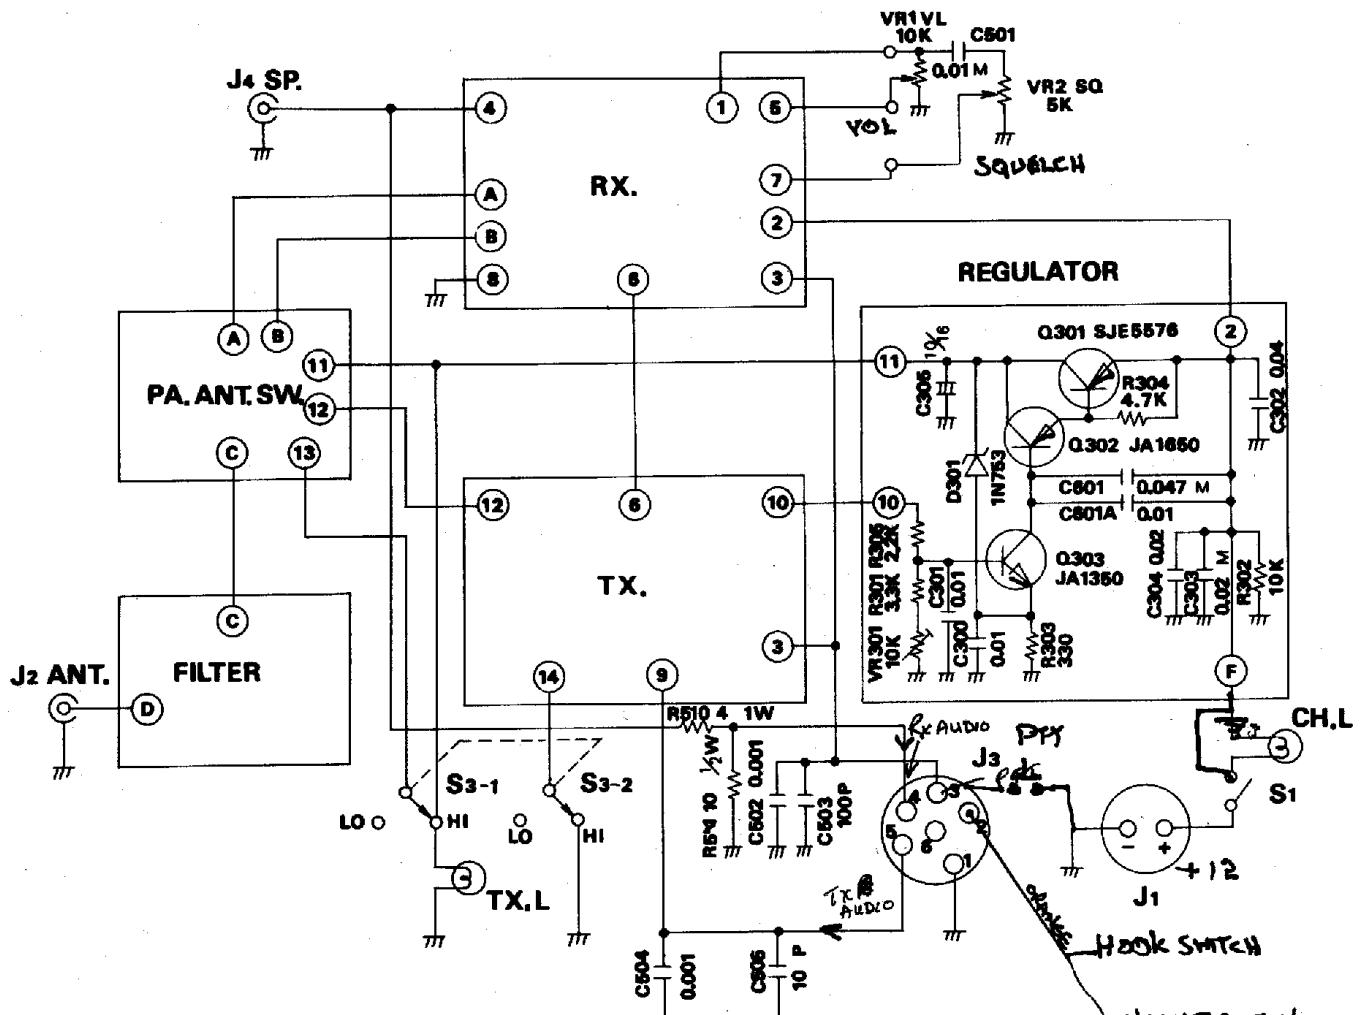

$$\text{Receive Crystal (MHz.)} = \frac{\text{Operatihg Freq. (MHz.)} - 16.9 \text{ MHz.}}{3}$$

$$\text{Transmit Crystal (MHz.)} = \frac{\text{Operating Freq. (MHz.)}}{18}$$

POWER AMPLIFIER CIRCUIT BOARD

[Note] MRF-238 should be soldered either after Printed Board is put on Shassis, or after it is temporarily put on A, B. Be sure of soldering after nuts are fixed.
