CHASSIS DIGI B PAU/SECAM/NTSC 443 (138)

The diagram is a complex electronic circuit for a radio receiver, specifically an RF-IF module. It is divided into several functional blocks:

- UHF-PREAMPLIFIER:** The first stage, featuring a transistor (T1) and various passive components for signal amplification.
- UHF-OSC.:** A section for UHF oscillation, including a transistor (T2) and a variable capacitor (C1) for tuning.
- UHF-MIXER:** The mixing stage, utilizing a transistor (T3) to combine the received signal with the local oscillator.
- AM TONE IF STAGE:** An intermediate frequency stage for AM signals, using a transistor (T4) and a variable capacitor (C2).
- PICTURE IF STAGE:** An intermediate frequency stage for video signals, featuring a transistor (T5) and a variable capacitor (C3).
- FM-DEMODULATOR:** A section for FM demodulation, using a transistor (T6) and a variable capacitor (C4).
- TUNER CONTROL:** A section for controlling the tuner, including a transistor (T7) and a variable capacitor (C5).
- CONVERTER BAND IF:** A section for converting the intermediate frequency to a standard IF, using a transistor (T8) and a variable capacitor (C6).
- PREAMPLIFIER:** A general-purpose preamplifier stage, using a transistor (T9) and a variable capacitor (C7).
- NON REGULE:** A non-regulated power supply section, using a transistor (T10) and a variable capacitor (C8).
- MIXER:** A general-purpose mixer stage, using a transistor (T11) and a variable capacitor (C9).

The circuit is powered by a 12V supply and includes a chassis board connection. It also features a TUNING VOLTAGE input and a BAND IF input.
