SERVICE MANUAL

NTSC

M1LXU1 Chassis

PA

No. 0018

31DX20B/CY23

R/C:CLU-670GJ

ATTENTION: Avant de mettre ce chassis en service, il est important que le technicien lise les "Mesures de sécurité" et "Avis concernant l'appareil" contenus dans le MANUAL DE SERVICE.

CAUTION: Before servicing this chassis, it is important that the service technician read the " Safety Precaution" and "Product Safety Notices" in this SERVICE MANUAL.

AVERTISSEMENT

Le plomb utilisé dans la soudure de ce produit est reconnu par l'agence de Santé et Bien-Être de la Californie comme produit toxique pouvant causer des malformations à la naissance ou autre domages physiques connexes (Code de Santé et Sécurité de la Californie (Section 25249.5).
Eviter tout contact avec la peau lors de l'entretien ou la manutention des circuits ou autres composantes pouvant contenir du plomb. Ne pas inhale les vapeurs ou fumées de soudure

WARNING

Lead in solder used in this product is listed by the California Health and Welfare agency as a known reproductive toxicant which may cause birth defects or other reproductive harm (California Health & Safety Code, Section 25249.5)

When servicing or handling circuit boards and other components which contain lead in solder, avoid unprotected skin contact with the solder. Also, when soldering do not inhale any smoke or fumes produced.

TELEVISION COULEUR/COLOR TELEVISION

OCTOBER/OCTOBRE 1992

CONSUMER ELECTRONICS DIVISION

INSTRUCTIONS DE SECURITE

AVERTISSEMENT: Etant donné que le châssis de ce récepteur de télévision est connecté au secteur en cours de fonctionnement, aucune réparation ne doit être engagée par quiconque ne connaissant pas les mesures de sécurité indispensables pour effectuer des travaux sur ce type de matériel. Les précautions suivantes doivent être observées:

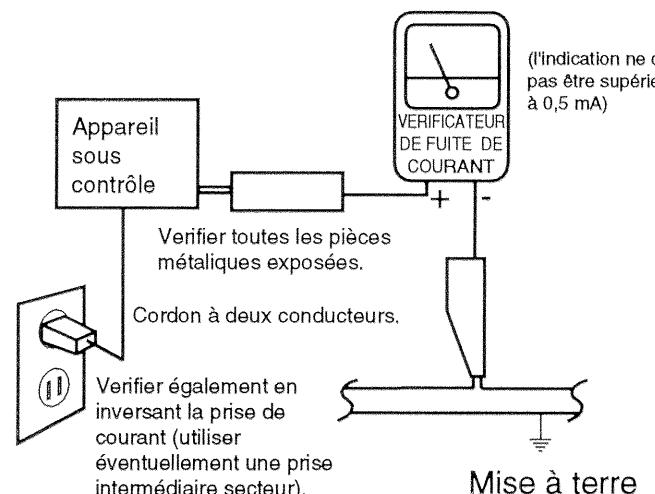

1. Ne pas installer ni déposer ou manipuler le tube image sans raison sans porter des lunettes de protection contre les éclats. Toute personne non équipée de la sorte doit se tenir éloignée des tubes images au moment de leur manipulation.
2. Quand une réparation doit être faite, un transformateur d'isolation doit être placé entre le secteur électrique et le récepteur de télévision; ceci est indispensable avant de procéder à toute réparation sur un châssis en état de marche.
3. Quand la plaque de montage d'un téléviseur doit être changée, les dispositifs de protection tels que: les dispositifs d'arrêt, les boutons non métalliques, le couvercle du coffret ou les écrans de protection, les condensateurs et résistances d'isolation etc. doivent être remis en place.
4. Quand une réparation doit être faite, respecter la disposition d'origine des fils. Une attention spéciale est requise en ce qui concerne le passage des fils dans l'étage à haute tension.
5. Employer toujours les composants de remplacement du fabricant, notamment les composants critiques qui sont ombragés sur le schéma de montage ne doivent, en aucun cas, être remplacés par ceux d'un autre fabricant. En outre, quand un court-circuit s'est produit, remplacer les composants qui donnent des signes de surchauffe évidente.
6. Avant de remettre un téléviseur réparé au client, le technicien en charge doit procéder à des essais complets du téléviseur pour être certain que son fonctionnement est normal et qu'il ne présente aucun risque de danger ou de décharge électrique; il doit aussi s'assurer que les dispositifs de protection incorporés dans le téléviseur n'ont pas subi de modification au cours des réparations. Par conséquent, les vérifications suivantes doivent être faites pour assurer une protection complète aux clients comme aux réparateurs.

Vérification complète de fuite de courant au repos. Après avoir débranché la prise du cordon de la prise de sortie secteur de 120V 60Hz, court-circuiter les deux tiges de la prise. Régler l'interrupteur général sur marche. Utiliser un contrôleur d'isolement (500VC.C.); brancher l'un des fils à la prise couplée, puis avec l'autre, toucher une partie métallique de l'appareil (antennes, têtes de vis, pièces métalliques exposées possédant notamment une voie de retour au châssis). Les pièces métalliques exposées possédant une voie de retour au châssis doivent posséder une résistance minimale de 0,24M ohms

et une résistance maximale de 5,2M ohms. Toute résistance inférieure à ces données indiquent une anomalie et ceci implique des mesures de correction. Les pièces métalliques exposées ne possédant pas de voie de retour au châssis indiqueront qu'il existe un circuit ouvert.

Vérification de fuite de courant sous tension.

Raccorder la prise du cordon dans une prise de sortie secteur de 120V 60Hz (ne pas utiliser de transformateur d'isolation pour effectuer cette vérification. Régler l'interrupteur général sur marche. Utiliser un vérificateur de fuite de courant (Simpson modèle 229 ou l'équivalent) et mesurer le courant qui provient des parties métalliques exposées du coffret de l'appareil (antennes, têtes de vis, revêtement métallique, axe de commande, etc.), les pièces métalliques exposées possédant notamment une voie de retour au châssis, à toute source de mise à la terre (conduite, tuyau de secteur, etc.. Le courant relevé ne doit pas dépasser 0,5mA

Vérification de fuite de courant secteur

TOUT RELEVE NE CORRESPONDANT PAS AUX TOLERANCES SPECIFIÉES PLUS HAUT INDIQUE UN RISQUE DE CHOC ELECTRIQUE ET LES REPARATIONS NECESSAIRES DOIVENT ÊTRE FAITES AVANT DE RENDRE LE TELEVISEUR AU CLIENT.

Haute tension

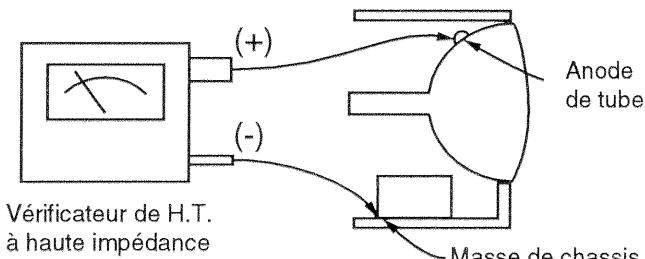

Ce téléviseur est équipé d'un circuit de protection de nature à fournir une indication précise d'une augmentation de tension en comparaison de la valeur pré-déterminée. Faire en sorte d'être conforme avec toutes les remarques de ce manuel de réparation concernant le circuit de protection au moment d'effectuer les réparations de telle sorte que ce circuit soit maintenu en parfait état de fonctionnement.

Avertissement au réparateur.

Quand le niveau de noir et la brillance de l'image sont minimum ,la haute tension de ce téléviseur est inférieur à 34.0kV. Si vous remplacez des composants dans les circuits d'horizontal et de haute tension ,s'assurer que la haute tension est de 34.0 kV quand le niveau de noir et la brillance de l'image est au minimum.

Le relevé de HT se fait à l'aide d'un vérificateur de H.T à haute impédance. Raccorder le pôle négatif (-) à la masse du chassis et le pôle positif (+) à l'anode du tube. (S'en tenir aux branchements spécifiés sur le schéma qui suit.)

Note: Débrancher le cordon d'alimentation de la prise murale avant de raccorder l'anode de la lampe écran.

Radiation de Rayons X

TUBE-IMAGE: La source primaire de radiation des rayons X de ce téléviseur est tout d'abord le tube-image. Le tube-image qui est employé pour le fonctionnement ci-dessus spécifié pour cette plaque de montage est d'une construction spéciale de nature à limiter les radiations de rayons X. Pour assurer une protection continue contre les radiations de rayons X, le tube-image de remplacement doit être identique au modèle d'origine et d'un type approuvé par HITACHI.

Au cours de la recherche de panne et des essais du

téléviseur présentant un problème de haute tension, éviter d'être trop près du tube-image et des composants à haute tension. Ne pas mettre le chassis sous une tension plus élevée que nécessaire pour localiser la panne ou l'excès de haute tension.

NOTICE DE SECURITE DE FABRICATION

De nombreux éléments électriques et mécaniques incorporés dans les téléviseurs HITACHI possèdent des caractéristiques évidentes de sécurité. Ces caractéristiques ne sont pas toujours évidentes par contrôle visuel et la protection assuré par ces éléments n'est pas forcément obtenue en utilisat des éléments de remplacement destinés pour une tension, un wattage supérieur, etc.

Les éléments de remplacement qui possèdent des caractéristiques de sécurité spéciales sont identifiés dans ce manuel de réparation.

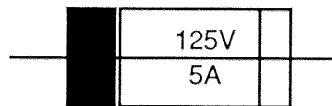

Les composants électriques qui possèdent ces caractéristiques sont identifiés par le symbole sur les schémas de montage et dans le catalogue de pièces de rechange de ce manuel de réparation. L'emploi de composants de remplacement ne possédant pas les mêmes caractéristiques de sécurité que les composants de remplacement recommandés par HITACHI indiqués dans le catalogue de pièces de rechange de ce manuel de réparation peuvent être à l'origine de décharge électrique, d'incendie, de radiation de rayons X ou présenter d'autres dangers.

Une production de fabrication est continuellement assurée par l'édition d'instructions nouvelles et revisées qui sont fournies de temps en temps. Pour connaître les renseignements les plus récents, consultez toujours le manuel de réparation HITACHI le plus récent. Une demande de manuel de réparation HITACHI ou de suppléments peut être faite auprès de votre HITACHI SALES CORPORATION pour une charge nominale.

ATTENTION

Le symbole suivant placé près du fusible d'alimentation correspond au fusible à fusion rapide qui doit être remplacé. La puissance du fusible est indiquée dans le symbole.

Exemple:

F981

La puissance du fusible F981 est de 5.0A -125V.

Remplacer le fusible avec un fusible de même puissance pour qu'une protection permanente contre l'incendie soit assurée.

SPECIFICATIONS TECHNIQUES

Impédance d'entrée d'antenne: 75 ohms (300ohms)

Canaux couverts:

VHF:	2 à 13
UHF:	14 à 69
CATV MID:	A-5 à A-1
	A à I
CATV SUPER:	J à W
CATV HYPER:	W+1 à W+28
CATV ULTRA:	W+29 à W+84

Entrée alimentation: Secteur altern.120V,60Hz

Consommation: 160W
Convergence: Auto-convergent
Focalisation: Electrostatique
Tube cathodique: M78JUA29X
 M78JUA29X01
 A79AEJ10X01

Haut-parleur: 2 haut-parleurs(60 x 120mm)
Sortie son: 3W x 2

Canaux de réception: 181 canaux

Indicateur de canal: Sur l'écran / forme numérique

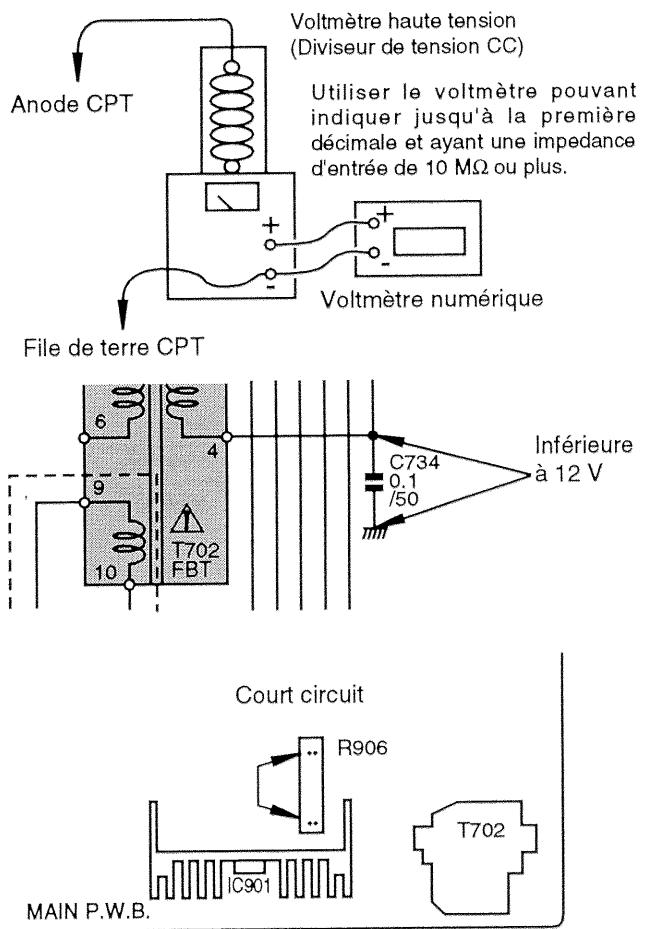

Fréquences intermédiaires:

Porteuse de fréquence
intermédiaire image: 45.75 MHz
Porteuse de fréquence
intermédiaire son: 41.25 MHz
fréquence intermédiaire
son: 4.50 MHz

PRECAUTIONS TECHNIQUES

Vérification du circuit limiteur haute tension

1. Connecter le voltmètre haute tension entre l'anode CPT(capuchon d'anode) et la terre (TP702) de la manière indiquée dans le diagramme.
2. Régler la tension d'entrée CA à $120 \pm 3V$.
3. Capter le signal d'émission et régler les résistances variables d'écran et de sous-intensité pour que l'intensité du faisceau soit de $1.60 \pm 0.1mA$. (À ce moment, la tension à la borne ABL de FBT- entre les deux extrémités de C734- doit être de 12 V ou moins.)
4. Vérifier qu'à ce moment la haute tension constante soit de $29.5 kV \pm 1.0 kV$.
5. Régler la tension d'entrée CA à $100 \pm 5 V$, puis court-circuiter les deux extrémités de R906.
6. Laisser les réglages des résistances variables d'écran niveau du noir et d'image comme dans l'article (3) et augmenter progressivement la tension d'entrée CA. Vérifier que l'image disparaît lorsque la haute tension est de $32.8kV \pm 1.3kV$.
7. Immédiatement après avoir vérifié que l'image disparaît, mettre l'interrupteur d'alimentation du récepteur sur la position "OFF".

SAFETY PRECAUTIONS

NOTICE: Comply with all cautions and safety related notes located on or inside the cabinet and on the chassis or picture tube.

WARNING: Since the chassis of this receiver is connected to one side of the AC power supply during operation, whenever the receiver is plugged in, service should not be attempted by anyone unfamiliar with the precautions necessary when working on this type of receiver.

The following precautions should be observed:

1. Do not install, remove, or handle the picture tube in any manner unless shatterproof goggles are worn. People not so equipped should be kept away while picture tubes are handled. Keep picture tube away from the body while handling.
2. When service is required, an isolation transformer should be inserted between power line and the receiver before any service is performed on a "HOT" chassis receiver.
3. When replacing a chassis in the receiver, all the protective devices must be put back in place, such as barriers, non-metallic knobs, adjustment and compartment cover-shields, isolation resistors-capacitors, etc.
4. When service is required, observe the original lead dress. Extra care should be taken to assure correct lead dress in the high voltage circuitry area.
5. Always use the manufacturer's replacement components. Especially critical components as indicated on the circuit diagram should not be replaced by a different manufacturer. Furthermore, where a short circuit has occurred, replace those components that indicate evidence of overheating.
6. Before returning a serviced receiver to the customer, the service technician must thoroughly test the unit to be certain that it is completely safe to operate without danger of electric shock, and be sure that no protective device built into the receiver by the manufacturer has become defective, or inadvertently defeated, during servicing.

Therefore, the following checks should be performed for the continued protection of the customer and service technician.

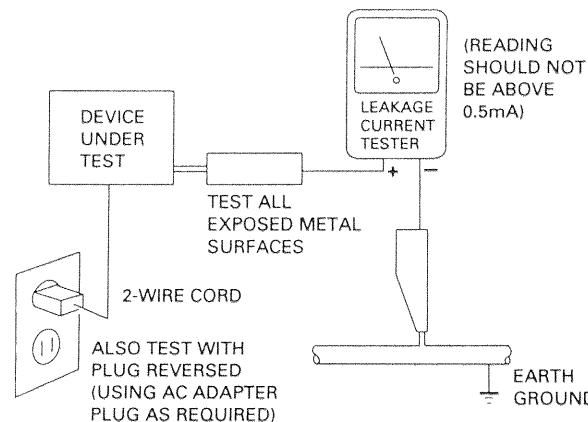

Leakage Current Cold Check

With the AC plug removed from the 120V AC 60Hz source, place a jumper across the two plug prongs. Turn the AC power switch on. Using an insulation tester (DC500V), connect one lead to the jumpered AC plug and touch the other lead to each exposed metal part (antennas, screwheads, metal overlays, control shafts, etc.), particularly any exposed metal part having a return path to the chassis. Exposed metal parts having a return path to the chassis should have a minimum resistor reading of $0.24\text{M}\Omega$ and a maximum resistor reading of $5.2\text{M}\Omega$. Any resistance value below or above this range indicates an abnormality which requires corrective action. Exposed metal parts not

having a return path to the chassis will indicate an open circuit.

Leakage Current Hot Check

Plug the AC line cord directly into an AC 120V 60Hz outlet (do not use an isolation transformer for this check). Turn the AC power switch on. Using a "leakage current tester (Simpson Model 229 or equivalent)," measure for current from all exposed metal parts of the cabinet (antennas, screwheads, metal overlays, control shafts, etc.), particularly any exposed metal part having a return path to the chassis, to a known earth ground (water pipe, conduit, etc.). Any current measured must not exceed 0.5mA.

AC Leakage Test

ANY MEASUREMENTS NOT WITHIN THE LIMITS OUTLINED ABOVE ARE INDICATIVE OF A POTENTIAL SHOCK HAZARD AND MUST BE CORRECTED BEFORE RETURNING THE RECEIVER TO THE CUSTOMER.

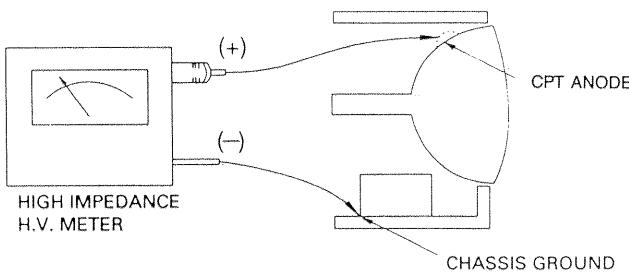

High Voltage

This receiver is provided with a hold down circuit for clearly indicating that voltage has increased in excess of a predetermined value. Comply with all notes described in this Service Manual regarding this hold down circuit when servicing, so that this hold down circuit is operated correctly.

Serviceman Warning

With minimum Black Level and Picture, the operating high voltage in this receiver is lower than 34.0kV. In case any component having influence on the high voltage is replaced, confirm that high voltage with minimum Black Level and Picture is lower than 34.0kV. To measure HV. use a high impedance H.V. meter. Connect (-) to chassis earth and (+) to the CPT anode button (see the following connection diagram).

NOTE: Turn the power switch off without fail before making any connection to the Anode button.

X-radiation

TUBE: The primary source of X-radiation in this receiver is the picture tube. The tube utilized in this chassis is specially constructed to limit X-radiation emission.

For continued X-radiation protection, the replacement tube must be the same type as the original, HITACHI approved type.

When troubleshooting and making test measurements in a receiver with an excessive high voltage problem, avoid coming unnecessarily close to the picture tube and the high voltage component.

Do not operate the chassis longer than is necessary to locate the cause of the excessive voltage.

PRODUCT SAFETY NOTICE

Many electrical and mechanical parts in HITACHI television receivers have special safety related characteristics. These are often not evident from visual inspection nor can the protection afforded by them necessarily be obtained by using replacement components rated for higher voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in this Service Manual. Electrical components having such features are identified with a Δ mark in the schematics and parts list in this Service Manual.

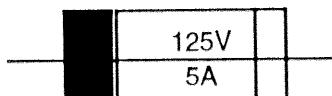

The use of a substitute replacement component which does not have the same safety characteristics as the HITACHI recommended replacement one, shown in the parts list in this Service Manual, may create shock, fire, X-radiation, or other hazards.

Product Safety is continuously under review and new instructions are issued from time to time. For the latest information, always consult the current HITACHI Service Manual. A subscription to, or additional copies of, HITACHI Service Manual may be obtained at a nominal charge from HITACHI HOME ELECTRONIC'S (AMERICA), INC.

CAUTION

The following symbol near the fuse indicates fast operation fuse to replaced. Fuse ratings appear with in the symbol.

Example:

F981

The rating of fuse F981 is 5.0A-125V.

Replace with the same type fuse for continued protection against fire.

TECHNICAL CAUTIONS

High voltage limiter circuit operation check

1. Connect the high voltage voltmeter between the CPT anode terminal (anode cap) and ground (TP702) as shown in the diagram.
2. Set the AC input voltage to $120 \pm 3V$.
3. Receive the broadcast signal and set the picture level and the black level to maximum. Adjust the screen VR and sub brightness VR so that beam current is 1.60 ± 0.1 mA. (The voltage at ABL terminal of FBT — between both ends of C734 — should be 12V or less at this time.)
4. Check that the constant high voltage is $29.5kV \pm 1.0kV$ at this time.
5. Set the AC input voltage to $100 \pm 5V$ and then short-circuit both ends of R906.
6. Leave the settings of the picture, black level and screen VRs as in item (3) and gradually increase the AC input voltage. Check that the picture disappears when the high voltage is $32.8kV \pm 1.3kV$.
7. Turn the switch of the set OFF immediately after checking that the picture disappears.

NOTICE DE SÉCURITÉ DE FABRICATION: Les composants qui sont accompagnés du symbole  et indiqués par une zone de couleur, possèdent des caractéristiques spéciales qui ont trait à la sécurité. Avant de procéder au remplacement de l'un de ces composants, lire attentivement la notice de sécurité de fabrication contenue dans ce manuel de réparation. Ne pas alterer le niveau de sécurité de l'appareil en procédant à des réparations erronées.

DIAGRAMME DE CIRCUIT DE BASE / BASIC CIRCUIT DIAGRAM

PRODUCT SAFETY NOTICE: Components marked with a and shaded have special characteristics important to safety. Before replacing any of these components, read carefully the PRODUCT SAFETY NOTICE of this Service Manual. Don't degrade the safety of the receiver through improper servicing.

- Etant donné que ceci représente un diagramme schématique de base, la valeur des éléments est sujette à modicaciton pour des raisons d'amélioration.

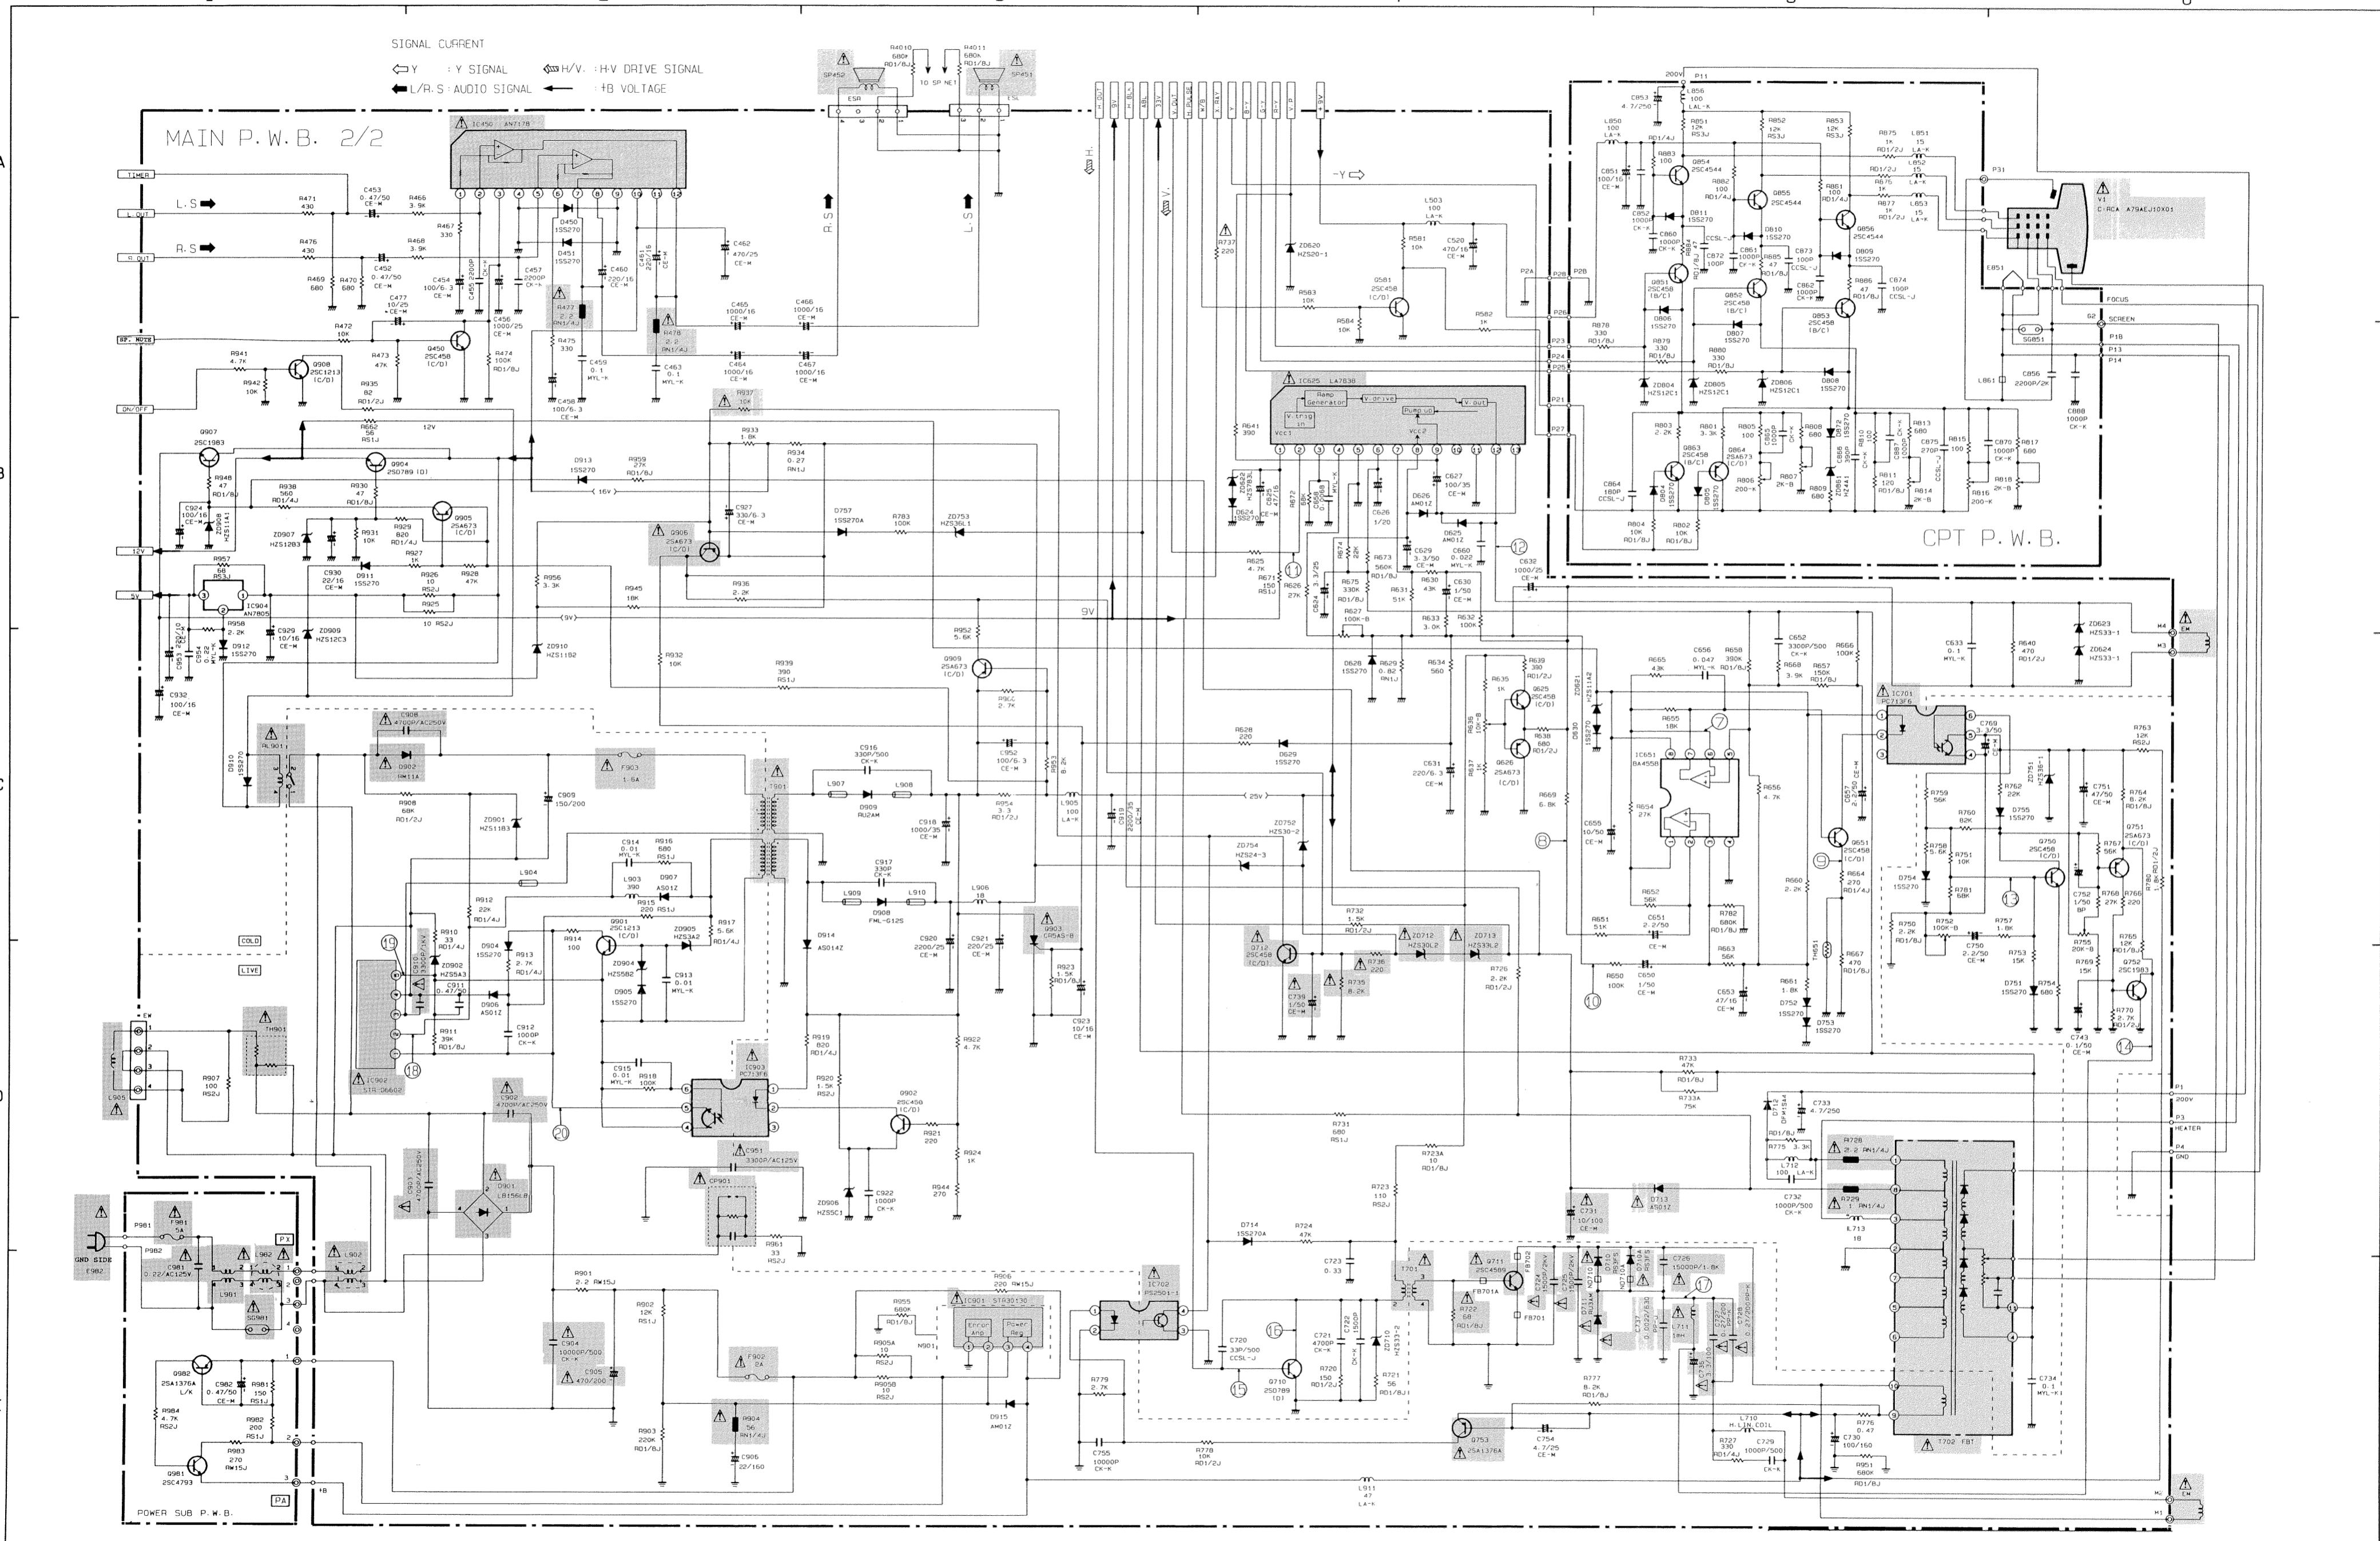

- Since this is a basic circuit diagram, the value of the parts is subject to be altered for improvement.

All DC voltage to be measured with a tester (100kΩ/V). Voltage taken on a complex color bar signal including a standard color bar signal.
