SERVICE MANUAL MANUEL DE SERVICE

NTSC

AP32, AP31 Chassis

PA

No. 0021

55EX7K/50EX6K
46EX3B/4K 50ES1B/K
46EX3BS/4KS

R/C: CLU-682GJ
R/C: CLU-681GJ
CLU-609

AP32 chassis is for models 55EX7K, 50EX6K, 46EX3B/BS, 46EX4K/KS using remote control CLU-682GJ.

AP31 chassis is for models 50ES1B, 50ES1K using remote control CLU-681GJ.

Le chassis AP32 est conçu pour les modèles 55EX7K, 50EX6K, 46EX3B/BS, 46EX4K/KS et ceux-ci utilisent la télécommande CLU-682GJ. Le chassis AP31 est conçu pour les modèles 50ES1B, 50ES1K et ceux-ci utilisent la télécommande CLU-681GJ.

Models 46EX3BS, 46EX4KS are identical to models 46EX3B, 46EX4K respectively except for the added Ultra Shield. Refer to replacement parts list for Ultra Shield parts.

Les modèles 46EX3BS, 46EX4KS sont identiques aux modèles 46EX3B, 46EX4K respectivement à l'exception de "Ultra Shield." Se referier à la liste des pieces de remplacement pour "L'Ultra Shield."

ATTENTION: Avant de mettre ce chassis en service, il est important que le technicien lise les "Mesures de sécurité" et "Avis concernant l'appareil" contenus dans le MANUEL DE SERVICE.

CAUTION: Before servicing this chassis, it is important that the service technician read the "Safety Precaution" and "Product Safety Notices" in this Service Manual.

Caractéristiques techniques et composants sont sujets à modification pour amélioration.

AUGUST / AOUT 1993

HHEA - MANUFACTURING DIVISION

SAFETY NOTICE

USE ISOLATION TRANSFORMER WHEN SERVICING

Components having special safety characteristics are identified by shading on the schematics and by  on the parts list in this service data and its supplements and bulletins. Before servicing the chassis, it is important that the service technician read and follow the "Safety Precautions" and "Product Safety Notices" in this Service Manual.

This service manual is intended for qualified service technicians; it is not meant for the casual do-it-yourselfer. Qualified technicians have the necessary test equipment and tools, and have been trained to properly and safely repair complex products such as those covered by this manual.

Improperly performed repairs can adversely affect the safety and reliability of the product and may void warranty. If you are not qualified to perform the repair of this product properly and safely, you should not risk trying to do so and refer the repair to a qualified service technician.

WARNING

Lead in solder used in this product is listed by the California Health and Welfare agency as a known reproductive toxicant which may cause birth defects or other reproductive harm (California Health and Safety Code, Section 25249.5).

When servicing or handling circuit boards and other components which contain lead in solder, avoid unprotected skin contact with solder. Also, when soldering do not inhale any smoke or fumes produced.

NOTICE DE SÉCURITÉ

SE SERVIR D'UN TRANSFORMATEUR DE SÉPARATION POUR EFFECTEUR LES DÉPANNAGES

Les composants qui possèdent des caractéristiques de sécurité spéciales sont identifiés par un ombrage sur les schémas de montage et par un symbole  dans la liste de pièces constitutives du présent manuel de données de dépannage, dans son supplément et les bulletins.

*Le tube-image doit être remplacé par un modèle identique au modèle d'origine ou par un tube-image dont la marque est recommandée par Hitachi de façon à avoir la certitude qu'une protection contre le rayonnement des rayons X est assurée.

Ce Manuel de service fut conçu afin d'être utilisé par des techniciens qualifiés et non pas des bricoleurs. Les techniciens qualifiés possèdent l'équipement et l'outillage appropriés et furent professionnellement formés à effectuer des réparations complexes sur les produits couvert par le présent manuel. Les réparations mal effectuées peuvent affecter la sécurité et l'intégrité du produit et ainsi annuler la garantie. Si vous n'êtes pas qualifié afin d'effectuer les réparations d'une façon professionnelle et sécuritaire veuillez vous référer à un technicien qualifié.

AVERTISSEMENT

Le plomb utilisé dans la soudure de ce produit est reconnu par l'agence de Santé et Bien-Être de la Californie comme produit toxique pouvant causer des malformations à la naissance ou autres dommages physiques connexes (Code de Santé et Sécurité de la Californie, Section 25249.5).

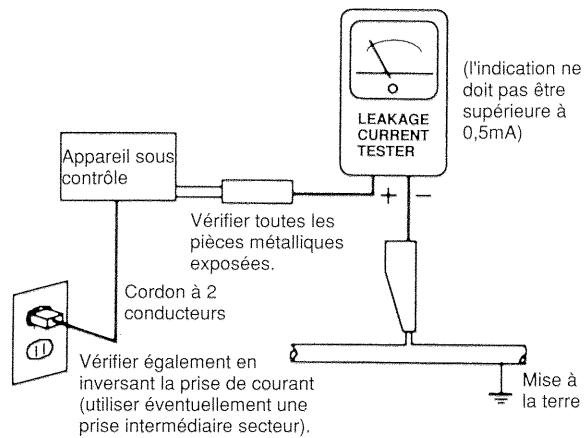

Eviter tout contact avec la peau lors de l'entretien ou la manutention des circuits ou autres composantes pouvant contenir du plomb. Ne pas inhaller les vapeurs ou fumées de soudure.

PRÉCAUTION DE SÉCURITÉ

1. Avant que le dépanneur ne rende l'appareil à son client, il doit s'assurer qu'il ne présente aucun danger ni risque d'électrocution après lui avoir fait subir tous les essais nécessaires et être certain que tous les dispositifs de sécurité incorporés à l'appareil fonctionnent normalement, ces essais étant les suivants:

- a. Vérifier que les dispositifs de protection incorporés ne sont ni défectueux ni/ou asservis pendant un dépannage. (1) Des blindages de protection sont installés dans le châssis pour mettre le dépanneur comme le client à l'abri de tout danger. Remplacer correctement tous les blindages de protection, notamment ceux qui ont été retirés pour que le dépannage soit plus facile à réaliser. (2) lors du remontage du châssis et/ou de tout autre organe dans le coffret de l'appareil, il convient de s'assurer que tous les dispositifs de protection sont parfaitement remis en place y compris, mais non seulement, les boutons non métalliques, les presspahns d'isolement, les plaques de blindage/couvercles de compartiment et de réglage, les réseaux d'isolement à résistances et capacités. L'appareil ne doit pas être mis en fonction et le dépanneur en charge ne doit permettre à personne de l'utiliser quant qu'il n'est pas muni de tous ses dispositifs de protection et que leur fonctionnement a été parfaitement vérifié. **Les dépanneurs asservissant ces dispositifs de protection ou qui n'effectuent pas les vérifications de sécurité nécessaires risquent d'être entièrement responsables des dommages qui en résulteraient**
- b. Vérifier qu'aucune ouverture du coffret ne permet à un adulte ou un enfant d'y introduire les doigts et se trouver en contact avec une tension dangereuse. Ces ouvertures sont notamment mais ne se limitent pas seulement (1) aux espaces entre le tube-image et le masque de coffret, (2) de trop grandes fentes d'aération de coffret et (3) le dos du coffret n'étant pas remonté complètement et/ou correctement.
- c. **Contrôle d'antenne à froid**—Après avoir débranché la prise d'alimentation secteur de la prise murale délivrant du courant alternatif, installer une connexion de jonction électrique entre les deux lamelles de la prise. Placer l'interrupteur général de l'appareil comme pour mettre sous tension. Appliquer une des pointes de touche d'un ohmmètre sur les lamelles de la prise reliées et toucher avec l'autre pointe de touche chaque vis de borne de connexion d'entrée d'antenne de syntoniseur exposée et le cas échéant, le connecteur de câble coaxial. Si la résistance relevée est inférieure à 1,0 Mégoohms ou supérieure à 12 Mégoohms, c'est la preuve qu'il y a une anomalie qui exige des réparations avant que l'appareil soit rendu au client. Refaire les mêmes essais, mais cette fois-ci en ayant pris soin de placer l'interrupteur général de l'appareil en position d'arrêt.

d. **Contrôle de fuites de courant à chaud** — Après avoir remonté complètement l'appareil, brancher directement la prise d'alimentation secteur dans une prise murale délivrant du courant alternatif de 120 V. (Ne pas se servir du transformateur de séparation pour effectuer cet essai.) Se servir d'un contrôleur de courant de fuite ou un système de mesure conforme aux normes de l'organisme américain de normalisation (ANSI) C101.0 Courant de fuite des appareils électriques et aux normes pour appareillages électriques (UL) 1410, (59.7). Placer tout d'abord l'interrupteur général de l'appareil en position de marche et le ramener sur arrêt et mesurer à partir d'une terre sûre (canalisation d'eau, conduite, etc.) toute partie métallique exposée de l'appareil (antennes, support de manipulation, coffrets métalliques, revêtements métalliques, têtes de vis, axes de dispositifs de réglage, etc.) notamment les parties métalliques exposées offrant une voie de retour électrique au châssis. Le courant relevé ne doit pas dépasser 0,5 millampère. Inverser la position de la prise d'alimentation dans la prise murale du secteur et refaire ces vérifications.

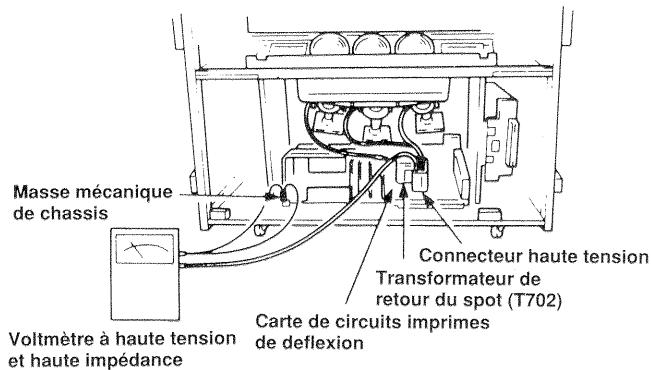

Vérification de fuites de courant secteur

TOUT RELEVÉ NE SE PLAÇANT PAS DANS LES LIMITES PRESCRITES CI-DESSUS MENTIONNÉES SIGNALE UN RISQUE DE DÉCHARGE ÉLECTRIQUE POTENTIELLEMENT DANGEREUSE QUI DOIT ÊTRE ÉLIMINÉ AVANT DE RENDRE L'APPAREIL AU CLIENT OU DE BRANCHER L'ANTENNE OU D'AUTRES ACCESSOIRES.

- e. **Haute tension** — Ce récepteur de télévision est équipé d'un circuit de maintien haute tension dans le but d'indiquer clairement que la tension a augmenté et dépasse la valeur prédéterminée. Se conformer à toutes les notices qui sont indiquées dans le manuel de dépannage relatives à ce circuit de maintien haute tension lors des dépannages pour que ce circuit fonctionne toujours correctement.

f. Rappel de sécurité destiné au dépanneur — Avec un réglage minimum des commandes de niveau du noir et d'image, la haute tension de service de ce récepteur de télévision est inférieure à 31.6. Quand des composants ayant une influence directe sur la haute tension sont remplacés, il convient de vérifier que la haute tension, avec un réglage minimum des commandes de niveau du noir et d'image, est inférieure à 31.6. Pour mesurer la haute tension, se servir d'un voltmètre à haute tension et haute impédance. Relier le pôle (-) à la masse mécanique du châssis et le pôle (+) à l'anode du tube cathodique (bouton T.H.T.). Procéder comme représenté sur le schéma de câblage ci-dessous).

Remarque: Ne pas oublier qu'il est impératif de placer l'interrupteur général en position d'arrêt avant d'effectuer le raccordement à l'anode du tube cathodique (bouton T.H.T.).

g. Rayonnement des rayons X — **Tube-image:** Le tube cathodique constitue la principale source de rayonnement des rayons X dans ce récepteur de télévision. Le tube cathodique utilisé dans ce récepteur de télévision est spécialement construit pour interdire l'émission des rayons X.

Pour qu'une protection permanente contre le rayonnement des rayons X soit assurée, le tube cathodique de remplacement qui est utilisé doit être du même type que l'original et être un modèle approuvé par HITACHI.

Au cours du dépannage et des mesures effectués dans le récepteur de télévision quand la panne est d'origine haute tension, éviter d'être trop près du tube cathodique et des composants haute tension.

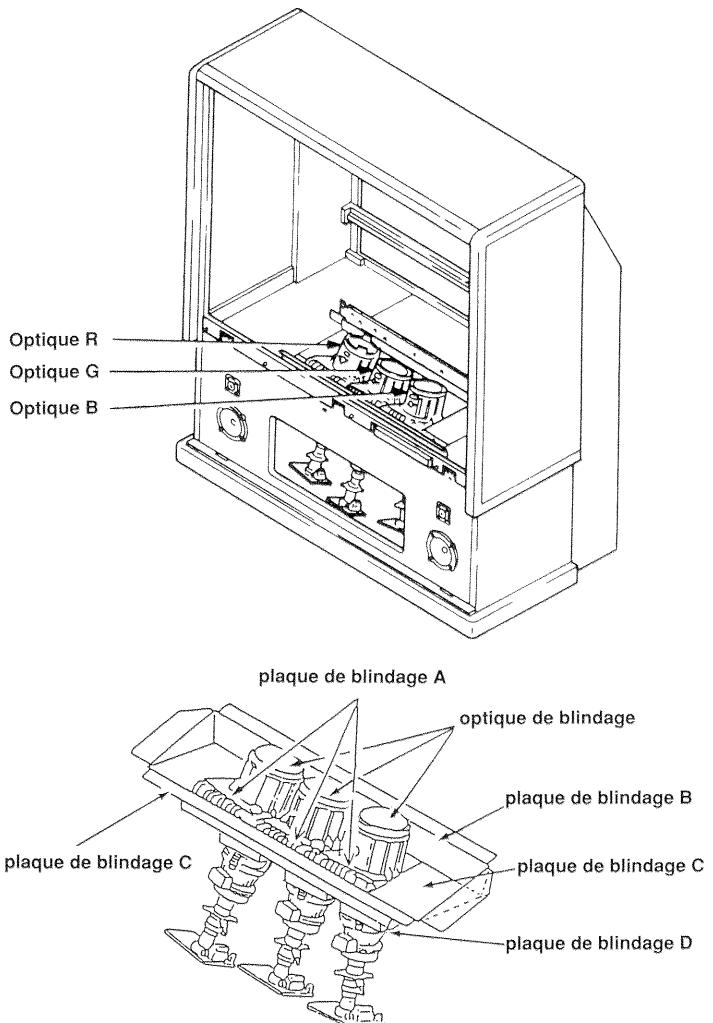

Le châssis ne doit pas fonctionner plus longtemps que nécessaire pour localiser la source d'émission excessive de tension.

h. Blindage de protection contre le rayonnement des rayons X

1) Ce récepteur de télévision est équipé de plaques de blindage assurant une protection contre le rayonnement des rayons X. Ne jamais supprimer les plaques de blindage de protection contre le rayonnement des

rayons X, A, B, C ou D représentés sur la fig. 1 valable pour effectuer un dépannage et/ou prélever des mesures de vérification.

2) Pour éviter tout rayonnement des rayons X après avoir remplacé le tube cathodique et les optiques, vérifier que ces composants sont bien remontés et fixés correctement sur la platine et le coffret de l'appareil et ne risquent pas de se détacher facilement.

Détails des blindages contre le rayonnement des rayons X

Fig. 1

2. Lire et se conformer à toutes les précautions et remarques relatives à la sécurité du coffret du récepteur de télévision, le châssis ou du tube cathodique.

3. **Mise en garde sur les modifications apportées à la conception de base** — Il ne faut jamais modifier ni ajouter des éléments mécaniques ou électriques à la construction de base du récepteur de télévision. Toute modification ou adjonction d'articles tels que des systèmes de branchement de sortie son et/ou d'image supplémentaires risquent d'affecter les caractéristiques de sécurité de ce récepteur de télévision et de favoriser une situation présentant un danger.

évident à l'utilisateur. Toute modification ou adjonction d'accessoires risquent d'entrainer l'invalidation de la garantie produite par le fabricant de l'appareil et peut vous rendre responsable, en tant que dépanneur, responsable des accidents corporels ou des dommages encourus qui en résultent.

4. **Mise en garde sur la protection contre l'implosion du tube cathodique** — Le tube cathodique du présent récepteur de télévision utilise un système de protection intégrale contre l'implosion. Pour qu'une protection permanente soit assurée contre l'implosion, le tube cathodique ne doit être remplacé que par un tube cathodique possédant un numéro de type identique. Il ne faut jamais déposer, reposer ou manipuler le tube cathodique sans avoir pris le soin préalable de porter des lunettes de protection à dispositifs de protection latéraux. Les personnes qui ne sont pas équipées ainsi doivent être suffisamment éloignées pendant les manipulations du tube cathodique. Eloigner le tube cathodique du corps. Ne pas manipuler le tube cathodique en le saisissant par son col.
5. **Mise en garde à propos d'un châssis sous tension** —
 - a. Certains châssis de récepteurs de télévision sont directement reliés électriquement à un conducteur du cordon d'alimentation secteur et ne peuvent être dépannés en toute sécurité sans l'usage d'un transformateur de séparation que dans la mesure où la prise d'alimentation secteur est branchée de telle sorte que la masse de la source d'alimentation secteur est directement reliée au châssis. Pour avoir la certitude que la prise d'alimentation secteur est branchée correctement, se munir d'un voltmètre à courant alternatif pour mesurer entre le châssis et une terre connue. Si la tension relevée est supérieure à 1,0V, débrancher la prise d'alimentation secteur et la rebrancher dans la prise en inversant sa position puis mesurer encore une fois le potentiel entre le châssis et une terre connue.
 - b. Certains châssis de récepteurs de télévision possèdent normalement une tension alternative de 85 V (efficace) entre le châssis et une terre sans qu'il soit tenu compte de la polarité de la prise d'alimentation secteur. Ces châssis ne peuvent être dépannés en toute sécurité qu'après avoir placé un transformateur de séparation sur la ligne d'alimentation entre le récepteur de télévision et la source d'alimentation secteur, autant pour la protection du dépanneur que pour l'équipement de dépannage.
 - c. Certains châssis de récepteurs de télévision possèdent un système de mise à la terre secondaire en plus de la mise à la terre principale du châssis. Il faut savoir que ce système de mise à la terre secondaire n'est pas isolé la ligne d'alimentation secteur. Les deux systèmes de mise à la terre sont parfaitement isolés électriquement par un matériau d'isolation qui ne doit en aucun cas être asservi ni modifié.

6. Respecter la disposition d'origine des fils électriques. Faire très attention au cheminement des fils électriques, notamment aux emplacements suivants:
 - a. les angles albus,
 - b. près des pièces et éléments chauds par dégagement thermique — auquel cas il convient de vérifier que les fils électriques ou les composants ne touchent jamais ces pièces et éléments,
 - c. l'alimentation secteur,
 - d. une haute tension et
 - e. les fils de raccordement d'antenne.Toutes les vérifications nécessaires doivent être faites à tous les niveaux de châssis pour s'assurer que les fils électriques ne sont ni pincés, ni déplacés ou usés de façon quelconque. Aucune modification ne doit être apportée quant à l'espacement entre les divers organes et composants et entre les composants et les cartes de circuits imprimés. Vérifier que le cordon d'alimentation secteur n'est pas endommagé.
7. Les composants, pièces et/ou le câblage électrique dégageant une chaleur anormale ou présentant tout autre forme d'endommagement doivent être remplacés par des composants, pièces ou éléments de câblage électrique conformes aux caractéristiques d'origine. En outre, la raison pour laquelle la chaleur anormale est dégagée doit être cernée ainsi que tout dommage tandis que les mesures de correction nécessaires doivent être prises pour éliminer tout risque de danger potentiel.
8. **NOTICE DE SÉCURITÉ DE PRODUIT** — De nombreuses pièces mécaniques et composants électriques de télévision possèdent des caractéristiques spéciales relatives à la sécurité de l'appareil, certaines d'entre elles n'étant pas toujours évidentes après une inspection visuelle comme la protection qu'elles doivent assurer n'est pas forcément obtenue si des composants de rechange prévues pour des tensions supérieures, wattage supérieur sont utilisés. Les pièces de rechange possédant de telles caractéristiques de sécurité spéciales sont identifiées dans les données de dépannage Hitachi par un ombrage dans les schémas de montage et par un symbole () dans la liste des pièces de rechange. L'emploi de composants de remplacement différents n'ayant pas des caractéristiques de sécurité identiques à celles qui possèdent les pièces de rechange recommandées dans les données de dépannage Hitachi indiquées dans la liste des pièces de rechange peuvent être à l'origine de décharges électriques, amorçage électrique et/ou tout autre accident du même type. La sécurité du produit fait l'objet d'une constante révision et de nouvelles instructions à ce sujet sont fournies au moment opportun. Il est indispensable de toujours s'informer en lisant la documentation de dépannage Hitachi la plus récente. Une demande d'obtention des plus récentes informations ou d'exemplaires supplémentaires à ce sujet peut être faite et les brochures reçues pour une somme modique en l'adressant à Hitachi.

PRÉCAUTIONS DE DÉPANNAGE

ATTENTION: Avant de procéder au dépannage d'appareils décrit dans les présentes données de dépannage et ses suppléments et additifs, lire et appliquer les PRÉCAUTIONS DE SÉCURITÉ mentionnées à la page 3 de cette documentation. N.B.: Si des circonstances imprévues se présentent et créent un conflit entre les précautions de sécurité mentionnées à la page 3 de cette documentation, il faut toujours appliquer les précautions de sécurité suivantes. N'oubliez pas la sécurité en premier.

Précautions générales de dépannage

1. Débrancher systématiquement la prise d'alimentation secteur de la prise secteur avant d'effectuer les opérations suivantes:
 - a. Dépose ou repose d'organes, composants, cartes de circuits imprimés, module ou tout autre ensemble.
 - b. Débranchement ou rebranchement de prise d'appareil électrique ou tout autre branchement électrique.
 - c. Branchement d'un appareil d'essai en parallèle à un condensateur électrolytique dans l'appareil.
- ATTENTION:** un remplacement de composant inappropriate ou un remontage de condensateurs électrolytiques sans respect des polarités risque de se conclure par une explosion.
- d. Décharge du contact T.H.T. du tube cathodique..
2. Ne vérifier la haute tension qu'en utilisant un contrôleur de haute tension approprié ou tout appareil de mesure de tension (voltmètre électronique, multimètre TEC, etc.) équipé de pointe de touche adaptée. Ne jamais vérifier une haute tension en provoquant un "arc électrique." La boîte de distribution haute tension possède une résistance interne de 400 Mégoohms (résistance de fuite) qui est connectée de la haute tension à la terre. Après avoir coupé le courant d'alimentation à l'appareil, la haute tension se décharge par l'intermédiaire de la résistance de fuite haute tension. Si les tubes sont chargés de haute tension après avoir coupé le courant d'alimentation, c'est l'indice que la résistance de fuite est défectueuse ou que la terre de la résistance de fuite est déconnectée.
3. Décharger l'anode T.H.T. des tubes cathodiques au niveau de l'une des sorties R, G ou B de la boîte de distribution haute tension uniquement (a) en raccordant tout d'abord l'extrémité d'un fil de pince isolante au système démagnétisation ou de blindage de masse d'aquadag là où les fils de masse de la prise du tube cathodique sont reliés puis (b) faire toucher l'autre extrémité du fil de pince isolante à la sortie R, G ou B de la boîte de distribution haute tension de tube cathodique en se servant d'une poignée isolante pour éviter tout contact avec la haute tension.
4. Ne jamais projeter de produits chimiques sur ou aux environs de cet appareil ou sur l'un quelconque de ses ensembles.

5. Sauf indication contraire mentionnée dans ces données de dépannage, nettoyer les contacts électriques en se servant de la préparation suivante et d'un ustensile d'entretien de tuyau, un coton-tige ou tout applicateur non abrasif; 10% (par volume) d'acétone et 90% (par volume) d'alcool isolopropyle (concentré entre 90 et 99%).

ATTENTION: Ce mélange est particulièrement inflammable. Sauf indication contraire mentionnée dans ces données de dépannage, la lubrification des contacts n'est pas nécessaire.

6. Ne jamais asservir les dispositifs d'accouplement de prise ou fiche de tension d'alimentation que les appareils décrits dans les présentes données de dépannage pourraient posséder.
7. Ne jamais appliquer le courant d'alimentation secteur à cet appareil et/ou à tout ensemble électrique tant que toutes les plaques de refroidissement à semi-conducteurs ne sont pas correctement installées.
8. Relier systématiquement le fil de terre de l'appareil de mesure à une masse mécanique appropriée du châssis avant d'appliquer la pointe de touche positive de l'appareil. Débrancher toujours le fil de terre de l'appareil de mesure en premier.
9. Ne se servir que des accessoires de fixation et d'essai mentionnés dans les données de dépannage avec cet appareil.

ATTENTION: Ne jamais relier le ruban de terre de l'accessoire d'essai à toute plaque de refroidissement de cet appareil.

Dispositifs sensibles électrostatiquement

Certains dispositifs à semi-conducteurs (transistorisés) sont aisément destructibles par l'électricité statique. Ces dispositifs sont plus spécialement désignés sous le vocable "Dispositifs sensibles électrostatiquement." Un exemple caractéristique de dispositif sensible électrostatiquement sont les circuits intégrés et quelques transistors à effet de champ et "puces" à semi-conducteurs. Les techniques suivantes doivent être utilisées pour limiter l'incidence de l'endommagement des composants par l'électricité statique.

1. Juste avant de manipuler un composant à semi-conducteur ou un ensemble constitué de semi-conducteurs, décharger l'électricité statique de votre corps en touchant une terre connue. Par ailleurs, se munir d'un dispositif à ruban porté au poignet pour décharge de l'électricité statique en vente dans le commerce, dispositif qui doit être retiré pour éviter toute décharge de courant avant de mettre l'appareil sous tension pour le soumettre aux essais.
2. Après avoir retiré un ensemble électrique équipé d'un dispositif sensible électrostatiquement, placer l'ensemble sur une surface conductrice telle qu'une feuille d'aluminium pour éviter toute charge d'électricité statique ou d'exposition de l'ensemble à l'électricité statique.
3. Ne se servir que d'un fer à souder dont l'extrémité est reliée à la terre pour souder ou dessouder les dispositifs sensibles électrostatiquement.

4. Utiliser uniquement un dispositif de décapage de soudure de type antistatique. Certains dispositif de décapage de soudure n'étant pas classés dans la catégorie des dispositifs antistatiques risquent de provoquer des décharge électriques capables d'endommager les dispositifs sensibles électrostatiquement.
5. Ne pas se servir de produits chimiques à base de liquide Fréon car ils peuvent engendrer des charges électriques suffisamment puissantes pour endommager les dispositifs sensibles électrostatiquement.
6. Ne jamais retirer un dispositif sensible électrostatiquement de remplacement de son emballage de protection tant que l'on n'est pas prêt à l'installer. (La plupart des dispositifs sensibles électrostatiquement de remplacement sont placés dans un emballage de protection et leurs fils électriques sont shuntés par l'intermédiaire de la mousse synthétique conductrice, du papier d'aluminium ou un matériau conducteur ayant des propriétés identiques.)
7. Juste avant de retirer le matériau de protection des fils de raccordement d'un dispositif sensible électrostatiquement de remplacement, mettre le matériau de protection en contact avec le châssis ou le circuit qui doit recevoir le dispositif sensible électrostatiquement.

ATTENTION: Aucun courant d'alimentation ne doit être appliqué au châssis ou au circuit concerné tandis que les précautions de sécurité qui s'imposent doivent être appliquées.

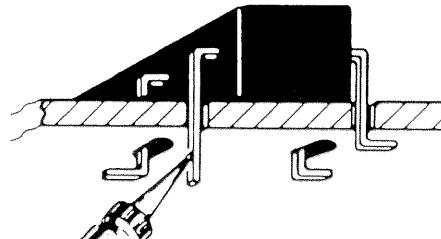

8. Eviter de vous déplacer pendant que le dispositif sensible électrostatiquement de remplacement est sorti de son emballage. (Toute opération potentiellement destructrice telle que le frottement des vêtements ou le décollement des pieds du sol revêtu d'un tapis peut engendrer la formation de l'électricité statique suffisamment puissante pour détruire le dispositif sensible électrostatiquement.

Conseils généraux relatifs à la soudure

1. Se servir d'un fer à souder basse tension dont l'extrémité est reliée à la terre et le diamètre et la forme sont appropriés pour maintenir une température à la pointe se situant entre 500°F et 600°F.
2. Se servir d'une soudure à la résine appropriée composée de 60 parts d'étain et 40 parts de plomb.
3. Nettoyer soigneusement la pointe du fer à souder.
4. Nettoyer soigneusement les surfaces à souder. Se servir d'une petite sole à poils métalliques 0.5 inch or 1.25 cm à poignée métallique. Ne pas se servir de produits chimiques à vaporiser à base de liquide Fréon.
5. Appliquer les techniques de soudage sousmentionnées:
 - a. Laisser la pointe du fer à souder atteindre une température normale (située entre 500°F et 600°F).
 - b. Réchauffer les fils du composant jusqu'à ce que la soudure commence à fondre.
 - c. Dégager rapidement la soudure fondu avec un dispositif antistatique de dégagement de soudure ou un dispositif d'aspiration ou encore, avec une tresse de soudure.

ATTENTION: Agir rapidement pour éviter de surchauffer la feuille de métal de la carte de circuits imprimés.

6. Appliquer les techniques de soudage sousmentionnées:
 - a. Laisser la pointe du fer à souder atteindre une température normale (située entre 500°F et 600°F).
 - b. Plaquer tout d'abord la pointe du fer à souder et la tresse de soudure contre les fils du composant jusqu'à ce que la soudure fonde.
 - c. Déplacement rapidement la pointe du fer à souder jusqu'à la limite de jonction des fils du composant et la feuille métallique de carte de circuits imprimés et l'y maintenir jusqu'à ce que la soudure soit liquide autour du fil du composant et de la feuille.
- ATTENTION:** Agir rapidement pour éviter de surchauffer la feuille de métal de la carte de circuits imprimés ou les composants.
- d. Examiner minutieusement la surface de soudure et retirer toute bavure ou éclaboussure de soudure avec une petite brosse métallique.

Se servir du fer à souder pour replier les fils

Dépose et remplacement de circuit intégré

Certaines cartes de circuits imprimés de châssis en bloc Hitachi sont munis de trous ovalisés par lesquels les fils de jonction des circuits intégrés sont introduits puis repliés endessous et contre le support du circuit. Si les trous sont ovalisés, la technique suivante doit être appliquée pour déposer et remplacer un circuit intégré. Utiliser la technique standard mentionnée aux alinéas 5 et 6 qui précédent pour les cartes de circuits imprimés munies de trous ronds ordinaires.

Dépose

1. Dessouder et redresser chaque fil de jonction du circuit intégré en une seule opération et en effectuant ce travail avec la pointe du fer à souder au fur et à mesure que la soudure fond.
2. Dégager la soudure fondu avec un dispositif d'élimination de soudure à aspiration de type antistatique (ou avec la tresse de soudure) avant de déposer le circuit intégré.

Remplacement

1. Introduire délicatement le circuit intégré dans la carte de circuits imprimés.
2. Replier délicatement chacun des fils de jonction du circuit intégré contre la surface du support et souder.
3. Nettoyer les surfaces soudées et retirer les bavures de soudure avec une petite brosse métallique. (Il est inutile d'effectuer une application acrylique sur ces surfaces.)

Dépose et remplacement de transistor discret à signaux faibles

1. Déposer le transistor défectueux en coupant ses fils de jonction le plus près possible du boîtier du composant.
2. Replier l'extrémité de chacun des trois fils de jonction en forme du "U" qui restent sur la carte de circuits imprimés.
3. Replier l'extrémité des fils de jonction en forme de "U" du transistor de remplacement.
4. Brancher les fils de jonction du transistor de remplacement aux fils correspondants qui sortent de la carte de circuits imprimés et sertir la partie en "U" avec une paire de pince à long bec pour réaliser un parfait contact de métal à métal et souder chaque liaison.

Dépose et remplacement de dispositifs à transistor de sortie

1. Réchauffer et retirer toute trace de soudure se trouvant sur les fils de jonction du transistor.
2. Retirer la vis de fixation de la plaque de refroidissement (s'il en est.).
3. Dégager délicatement le transistor de la carte de circuits imprimés.
4. Introduire le transistor dans la carte de circuits imprimés.
5. Souder chaque fil de jonction du transistor et couper l'excédent de fil.
6. Remplacer la plaque de refroidissement.

Dépose et remplacement de diode

1. Retirer la diode défectueuse en coupant les fils de jonction le plus près possible du boîtier de la diode.
2. Replier les deux fils de jonction qui restent à la perpendiculaire de la carte de circuits imprimés.
3. Respecter la polarité de la diode, torsader chacun des fils de jonction de la diode nueve autour du fil correspondant de la carte de circuits imprimés.
4. Serrer solidement chaque raccordement et souder.
5. Vérifier (du côté cuivré de la carte de circuits imprimés) si les jonctions de soudure de deux fils de jonction d'origine sont normales. S'ils ne sont pas luisants, les réchauffer et au besoin, ajouter de la soudure.

Dépose et remplacement de fusible et de résistance ordinaires

1. Couper les fils de jonction de chaque fusible ou de résistance en haut du tube creux de la carte de circuits imprimés.
2. Retenir solidement les fils de jonction du composant de remplacement à 1/8 de pouce du haut du tube creux.
3. Souder les fils de jonction.

ATTENTION: Respecter l'écartement d'origine entre le composant remplacé et les composants voisins et la carte de circuits imprimés pour éviter toute formation excessive de température dans les composants.

Réparation de la surface métallique de carte de circuits imprimés

Toute température excessive appliquée à la feuille cuivrée d'une carte de circuits imprimés provoque un affaiblissement de l'adhérent de liaison de la feuille cuivrée sur la carte de circuits imprimés, ce qui provoque une séparation ou le décollement de la feuille culvrée. Les recommandations et procédés suivants doivent être appliqués quand ceci est remarqué.

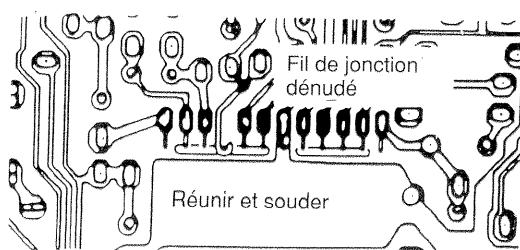

Zones critiques de surface cuivrée

Une grande densité de composants et surface cuivrée et/ou la présence de tension spéciales ou de caractéristiques d'intensités également spéciales ainsi que l'espacement et l'intégrité de la surface cuivrée de certaines zones d'une carte de circuits imprimés les rendent plus critiques que d'autres. La feuille cuivrée de ces zones est désignée sous l'appellation de "Surface cuivrée critique" tandis qu'elles sont identifiées et illustrées dans les données de dépannage dans le chapitre intitulé "Sécurité relative à la surface cuivrée (se reporter au tableau de la table des matières pour connaître le numéro de page). La surface cuivrée critique exigeant des techniques de soudage spéciales pour avoir la certitude que les normes de sécurité relatives à la maintenance et au dépannage sont respectées, il est préférable de s'informer auprès des spécialistes Hitachi.

Raccordement de circuit intégré

La restauration d'une surface soudée de circuit intégré endommagée est réalisée en appliquant la technique suivant qui consiste tout d'abord à installer un fil de jonction sur la surface cuivrée de la carte de circuits imprimés. (Cette technique ne doit être utilisée que pour le raccordement de circuit intégré.)

1. Décoller délicatement la partie endommagée de la surface cuivrée avec un couteau. (Découper la moins possible de surface cuivrée.)
2. Gratter délicatement les restes de soudure et de couche acrylique (s'il en est) du bord de ce qui reste de surface cuivrées.

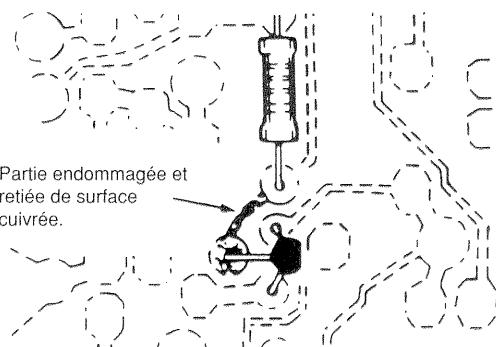

Installer le fil de jonction et souder

3. Former un petit "U" au bout du fil de jonction de faible calibre et le fixer délicatement autour de la broche du circuit intégré. Souder la jonction du circuit intégré.
4. Faire passer le fil de jonction en suivant la partie découpée de la surface cuivrée et le superposer à la partie de surface cuivrée qui est en bon état. Souder la surface superposée et couper l'excédent de fil de jonction.

A d'autres emplacements

Utiliser la technique suivante pour restaurer la surface cuivrée endommagée à l'état normal au niveau des branchements autres que les broches de circuit intégré. Cette technique oblige à installer un fil de jonction sur la carte de circuits imprimés côté composant.

Fil de jonction isolé

1. Retirer la surface cuivrée endommagée avec un couteau. Retirer au moins 1/4 de pouce de cuivre pour avoir la certitude que des conditions dangereuses ne subsistent pas au cas où le fil de jonction se couperait.
 2. Tracer sur la surface cuivrée et des deux côtés de la rupture jusqu'à localiser le composant le plus proche qui est directement relié à la surface cuivrée affectée.
 3. Brancher du fil de jonction isolé de calibre 20 du fil de raccordement du composant le plus proche d'un côté de la surface cuivrée abîmée au fil de jonction du composant le plus proche de l'autre côté. Retenir solidement et souder.
- ATTENTION:** Vérifier que le fil de jonction isolé est acheminé de telle sorte qu'il ne touche pas les composants ou des angles aigus.

Systèmes d'accord de synthèse de fréquence

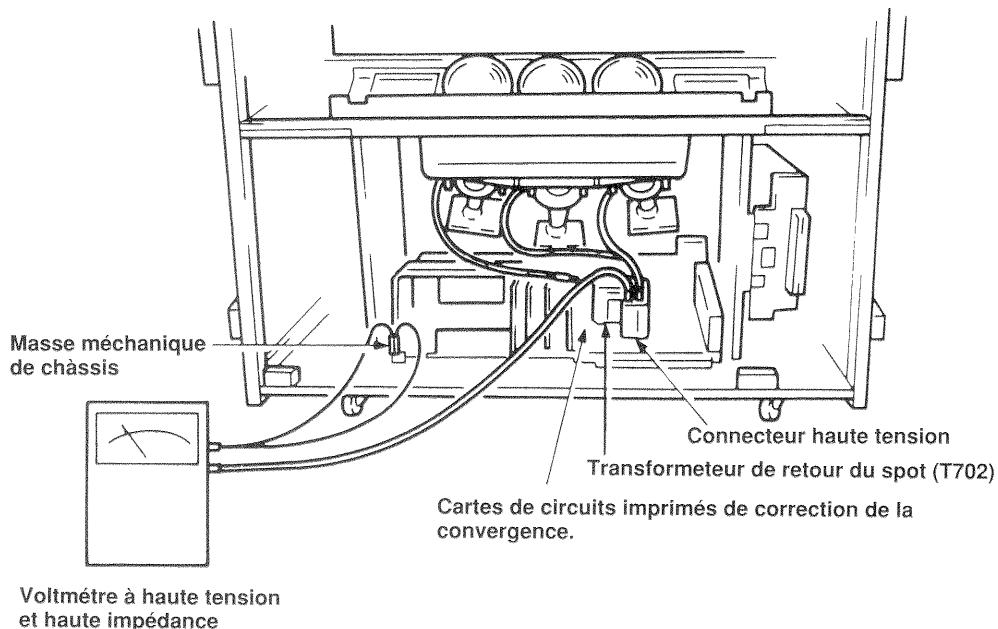

1. Débrancher systématiquement le cordon d'alimentation de l'appareil avant de débrancher ou rebrancher un système d'accord de synthèse de fréquence mais aussi avant de déposer ou remettre en place des modules de système d'accord de synthèse de fréquence.
2. Le syntoniseur de système d'accord de synthèse de fréquence ne doit jamais être débranché du module de contrôle d'accord de système d'accord de synthèse de fréquence quand l'appareil est sous tension.
3. Quand des pannes irrégulières se produisent et semblent provenir de défauts de raccordement de câble au système d'accord de synthèse de fréquence, isoler immédiatement l'appareil de l'alimentation secteur dès que le connecteur défectueux est localisé et continuer à confirmer le branchement défectueux en effectuant un essai de continuité. Cette façon de limiter les risques de surtension des semi-conducteurs du système d'accord de synthèse de fréquence.

PRÉCAUTIONS TECHNIQUES

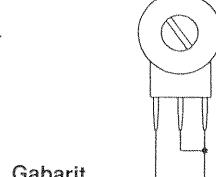

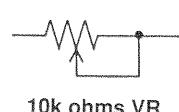

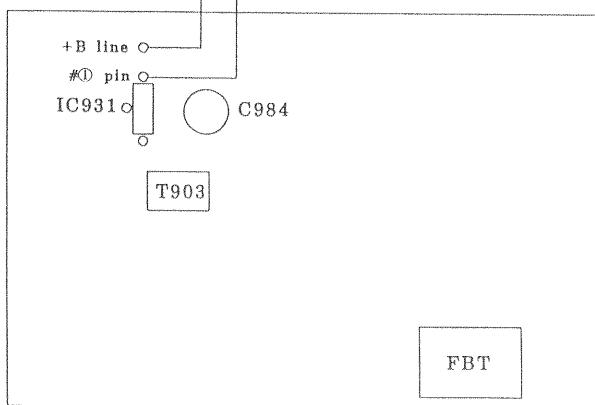

Vérification du fonctionnement du circuit limiteur de haute tension

- Connectez le voltmètre haute tension entre le connecteur haute tension et la terre de châssis de la manière indiquée en Fig. 2.
2. Réglez la tension d'entrée secteur à 130V.
 3. Capter le patron régulier sur votre écran, et réduire doucement la fréquence avec votre gabarit jusqu'à ce que l'image disparaît et que votre téléviseur s'éteigne complètement.

4. Quant votre circuit opère correctement, votre haut-voltage devrait être en-dessous de 35.5KV à 0.6mA à ce moment votre circuit s'étendra.
5. Fermer immédiatement votre téléviseur après la vérification du circuit.
6. Débrancher votre téléviseur pour environ 1 minute afin de rétablir le courant. Enlever votre gabarit et votre appareil de mesure.

Débrancher la goupille #① du IC931 de la ligne +B.
Brancher le gabarit (10k ohms VR) entre la ligne +B et la goupille #① du IC931.

RENSEIGNEMENT GÉNÉRAUX

Panneau de branchement arrière
Fig. 4

RÉGLAGE DE L'IMAGE ET FONCTIONS DU MODE SON

Appuyer sur MENU, 2 ENTER sur la télécommande afin d'obtenir l'affichage des fonctions PICTURE.

PICTURE PROGRAM est pour votre réglage préféré - contraste, couleur, etc.

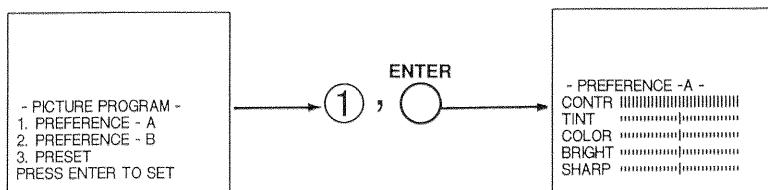

PICTURE SETTINGS est utiliser pour améliorer la qualité de l'image.

CONVERGENCE ADJ. est utiliser afin d'aligner les trois couleur (rouge, vert, bleu) de façon à obtenir une image claire..

• PROGRAMME IMAGE (PICTURE PROGRAM)

Il y'a deux réglages préférée "A et B" ou utiliser fait a l'usine PRESET.

Appuyer sur MENU, 2, ENTER, 1, ENTER afin de sélectionner PICTURE PROGRAM.

Appuyer sur les touches de curseur afin de sélectionner et régler les fonctions.

CONTRASTE (CONTR) — Utiliser cette commande afin de régler le niveau du noir et du blanc de l'image. Cette ajustement affectera l'image seulement si PICTURE SETTING AI est à la position OFF.

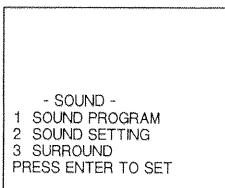

TEINTE (TINT) — Permet de régler le ton de la peau de façon que cette dernière paraisse naturelle.

COULEUR (COLOR) — Utiliser cette commande afin de régler le niveau de couleur de l'image.

BRILLIANCE (BRIGHT) — Cette commande permet de régler la brillance de l'image entière.

NETTÉTÉ (SHARP) — Cette commande permet de régler les menus détails de l'image. Cette ajustement affectera l'image seulement si PICTURE SETTING AI est à la position OFF.

Appuyer sur MENU, 3, ENTER sur la télécommande afin d'obtenir les fonctions du mode SOUND.

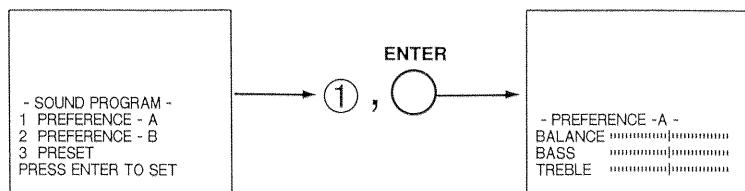

SOUND PROGRAM est pour vos réglages préférés - équilibrage, grave, algus, etc.
SOUND SETTING est utiliser pour améliorer la qualité sonore.

• PROGRAMME SON (SOUND PROGRAM)

Vous avez deux choix de réglage préféré A et B, ou vous pouvez utiliser les réglages.

Appuyer sur MENU, 3, ENTER, 1, ENTER afin de sélectionner SOUND PROGRAM.

Appuyer sur le curseur afin de sélectionner et effectuer les ajustements.

ÉQUILIBRAGE — Cette commande contrôle l'équilibre des niveaux sonores gauche et droit des haut-parleurs internes du (BALANCE) téléviseur, la sortie AUDIO TO HI-FI ainsi que les haut-parleurs amblophinique. La commande d'équilibrage du niveau sonore est aussi trouvée dans la fonction DOLBY TEST.

GRAVE (BASS)— Cette commande contrôle les sons graves sur tous les haut-parleurs.

ALGU (TREBLE) —Cette commande contrôle les sons algus sur tous les haut-parleurs.

CODES DE RÉPARATION DE L'AUTO-VÉRIFICATION

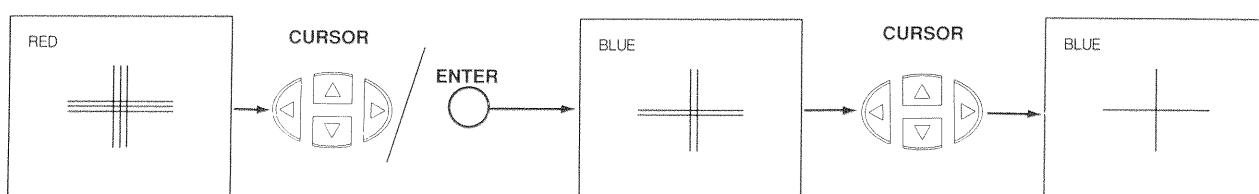

Appuyer simultanément sur la touche AVX et sur la touche POWER.

| CODE | PHÉNOMÈNES DÉTECTÉS | TEMPS DE DÉTECTION | REMARQUES |
|------|--|----------------------------|--|
| 40 | Déflexion horizontale anormale | --- | --- |
| 41 | Le transformateur de retour de spot puisse sa charge sur la linge de 12 volt | --- | --- |
| 50 | Le relais de puissance un position arrêt | --- | Condition anormale causant l'arrêt du relais |
| 10 | Vérifier pour le PLL verroués | Noon vérrouillé | Durant le temps de selection |
| 11 | Vérifier pour l'opération | Non terminé enn 2 sec. | Durant le temps de selection |
| 60 | Vérifier l'entrée AC | Temps de restoration at uP | L'entrée AC (50/60 Hz) non détectes durant le temps de restoration |
| 31 | Vérifier l'operation du IC0001 | Temps de restoration at uP | Vérifier si l'operation est à l'intérieur des limites spécifiées |

Remarque: Les codes 10 ou 11 peuvent apparaître si le téléviseur est mis en marche sans être brancher à une source d'antenne.

RÉGLAGE DE LA CONVERGENCE

Appuyer sur MENU, 2, ENTER, 3, ENTER sur la télécommande afin d'obtenir l'affichage des ajustements de la convergence.

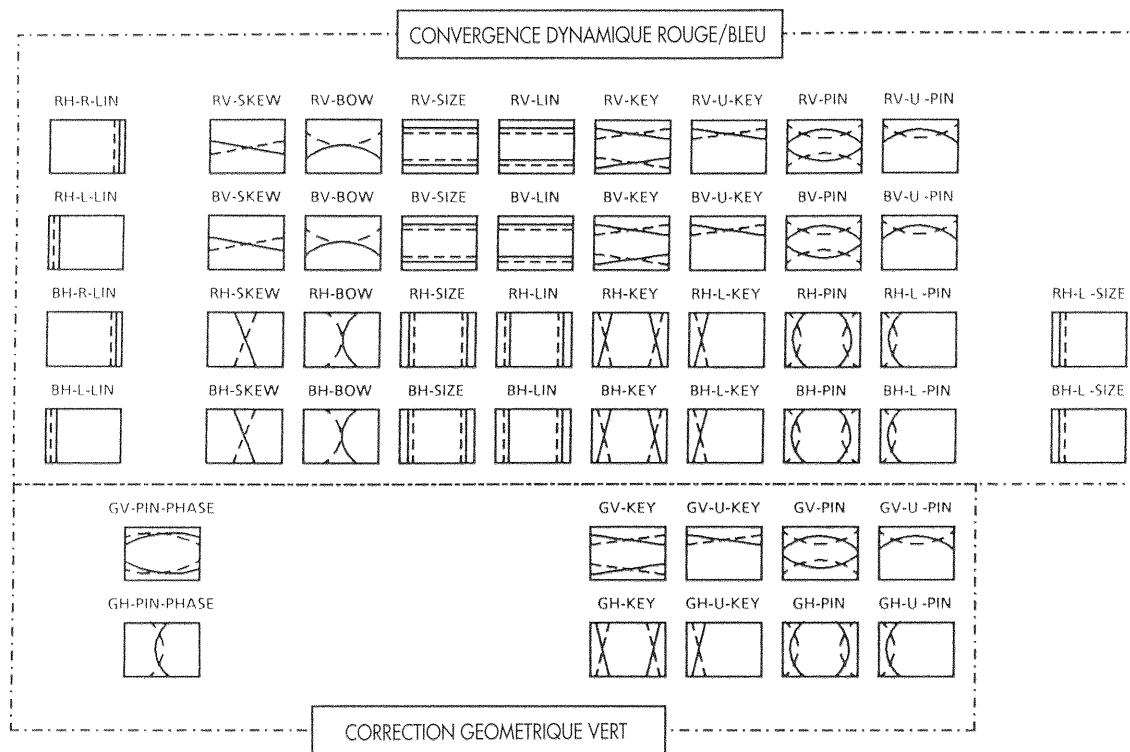

Appuyer sur le curseur **▲, ▼** afin de déplacer l'affichage de couleur vers le haut ou vers le bas.

Appuyer sur le curseur **◀, ▶** afin de déplacer l'affichage de couleur vers la droite ou vers la gauche.

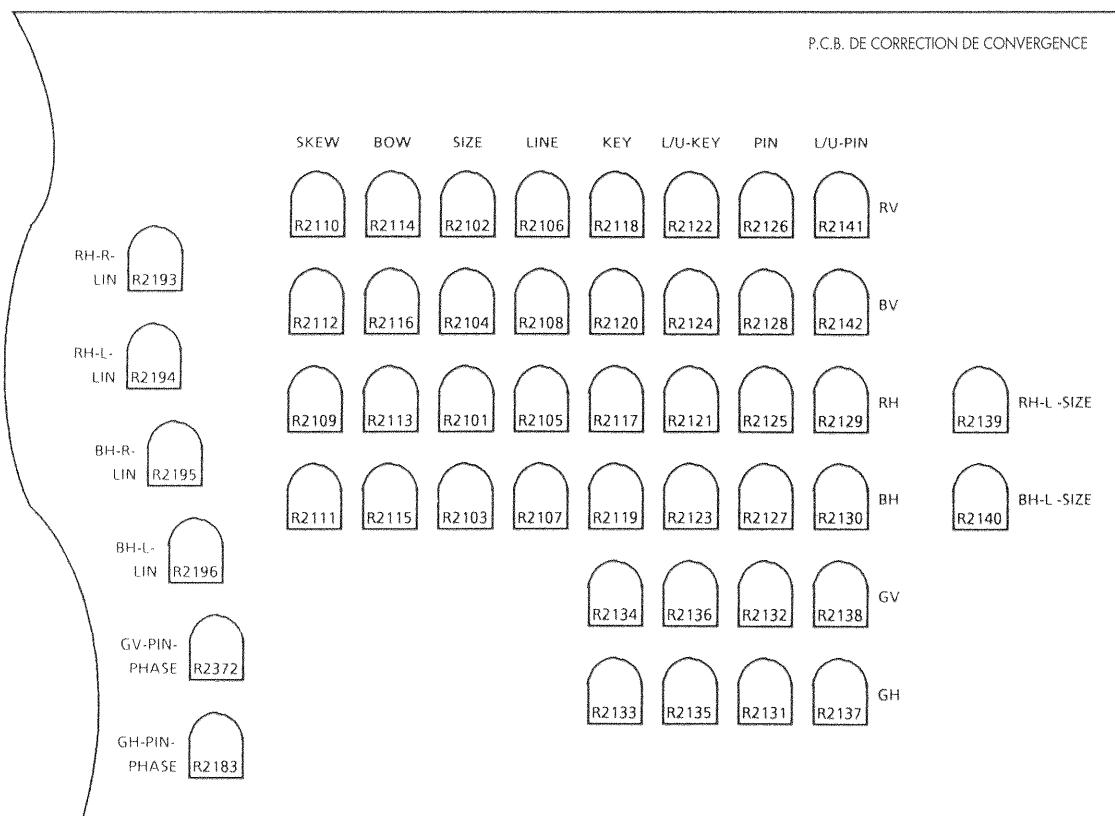

Appuyer sur ENTER pour changer de couleur.

Appuyer sur MENU pour sortir.

Convergence dynamique

Implantation des VR de réglage

PRECAUTIONS A PRENDRE EN CAS CONNEXION/DECONNEXION DU CONNECTEUR HT

Effectuer les points suivants lorsque le connecteur HT (connecteur d'anode) est retiré ou inséré pour le remplacement CPT, etc.

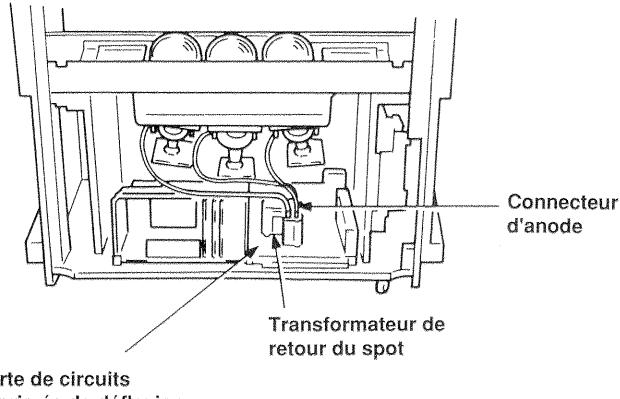

Fig. 5

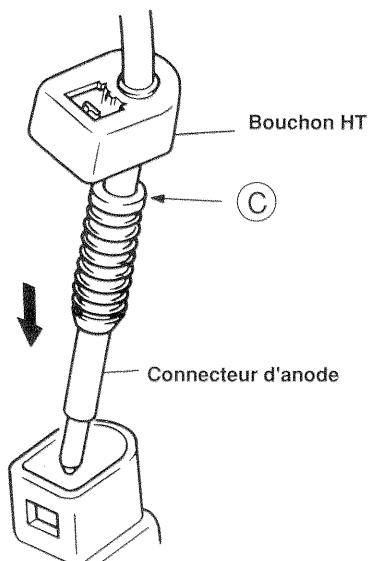

Fig. 7

Pendant le retrait

1. Insérer une petit tournevis à lame plate (tournevis de réglage : 5-7 mm de large et 0.2-0.3 mm d'épaisseur) dans la section (A) de la Fig. 6, puis l'enfoncer dans la direction de la flèche (B). Le verrou se libère avec un déclic. (L'état de la Fig. 8-(1) change à celui de la Fig. 8-(2).)

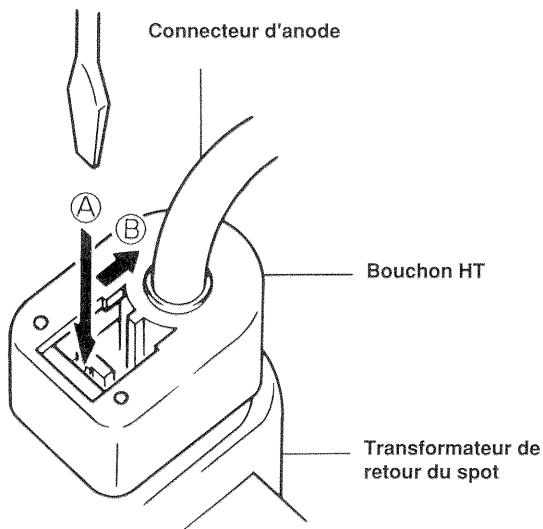

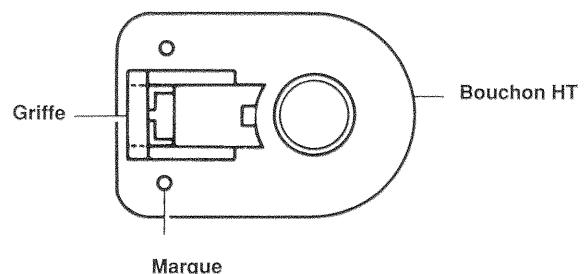

Fig. 6

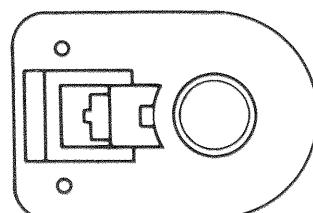

2. Retirer le bouchon HT et déposer le connecteur d'anode (Fig. 7).

Pendant l'insertion

1. Insérer profondément le connecteur d'anode dans le FBT (à la section (C) de la Fig. 7), puis enfoncez le bouchon HT dans le FBT jusqu'à ce qu'un déclic se fasse entendre.
2. Vérifier que le connecteur est bien inséré. (Vérifier que la griffe est au niveau de la marque située sur le bouchon HT comme dans la Fig. 8-(1)).

- (1) Verrouiller
(Lorsque le connecteur est inséré)

- (2) Libérer
(Lorsque le connecteur est retiré)

Fig. 8

SAFETY NOTICE
USE ISOLATION TRANSFORMER WHEN SERVICING

Components having special safety characteristics are identified by a  on the schematics and on the parts list in this Service Data and its supplements and bulletins. Before servicing this chassis, it is important that the service technician read and follow the "Safety Precautions" and "Product Safety Notices" in this Service Manual.

*For continued x-radiation protection, replace picture tube with original type or Hitachi approved equivalent type.

This service manual is intended for qualified service technicians; it is not meant for the casual do-it-yourselfer. Qualified technicians have the necessary test equipment and tools, and have been trained to properly and safely repair complex products such as those covered by this manual.

Improperly performed repairs can adversely affect the safety and reliability of the product and may void warranty. If you are not qualified to perform the repair of this product properly and safely, you should not risk trying to do so and refer the repair to a qualified service technician.

WARNING

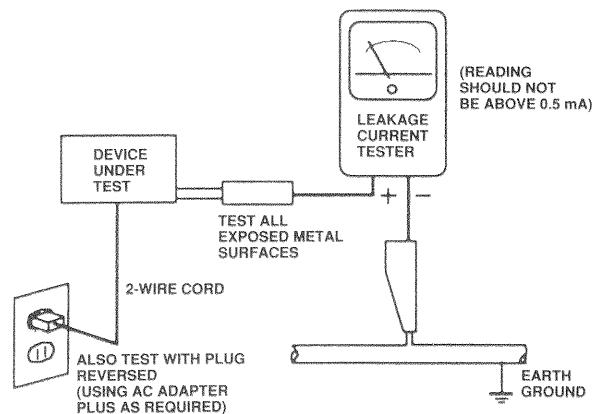

Lead in solder used in this product is listed by the California Health and Welfare agency as a known reproductive toxicant which may cause birth defects or other reproductive harm (California Health and Safety Code, Section 25249.5).

When servicing or handling circuit boards and other components which contain lead in solder, avoid unprotected skin contact with solder. Also, when soldering do not inhale any smoke or fumes produced.

This television receiver provides display of television closed captioning in accordance with section 15.119 of the FCC rules.

SAFETY PRECAUTIONS

1. Before returning an instrument to the customer, always make a safety check of the entire instrument, including but not limited to the following items:
 - a. Be sure that no built-in protective devices are defective and/or have been deleted during servicing. (1) Protective shields are provided on this chassis to protect both the technician and the customer. Correctly replace all missing protective shields, including any removed for servicing convenience. (2) When reinstalling the chassis and/or other assembly in the cabinet, be sure to put back in place all protective devices, including but not limited to, nonmetallic control knobs, insulating fishpapers, adjustment and compartment covers/shields, and isolation resistor/capacitor networks. **Do not operate this instrument or permit it to be operated without all protective devices correctly installed and functioning.** Servicers who defeat safety features or fail to perform safety checks may be liable for any resulting damage.
 - b. Be sure that there are no cabinet openings through which an adult or child might be able to insert their fingers and contact a hazardous voltage. Such openings include, but are not limited to (1) spacing between the picture tube and cabinet mask, (2) excessively wide cabinet ventilation slots, and (3) an improperly fitted and/or incorrectly secured cabinet back cover.
 - c. **Antenna Cold Check** — With the instrument AC plug removed from any AC source, connect an electrical jumper across the two AC plug prongs. Place the instrument AC switch in the on position. Connect one lead of an ohmmeter to the AC plug prongs tied together and touch the other ohmmeter lead in turn to each tuner antenna input exposed terminal screw and, if applicable, to the coaxial connector. If the measured resistance is less than 1.0 megohms or greater than 5.2 megohms, an abnormality exists that must be corrected before the instrument is returned to the customer. Repeat this test with the instrument AC switch in the off position.
 - d. **Leakage Current Hot Check** — With the instrument completely reassembled, plug the AC line cord directly into a 120V AC outlet. (Do not use an isolation transformer during this test.) Use a leakage current tester or a metering system that complies with American National Standards Institute (ANSI) C101.0 Leakage Current for Appliances and Underwriters Laboratories (UL) 1410, (50.7). With the instrument AC switch first in the on position and then in the off position, measure from a known earth ground (metal waterpipe, conduit, etc.) to all exposed metal parts of the instrument (antennas, handle bracket, metal cabinet, screw heads, metallic overlays, control shafts, etc.), especially any exposed metal parts that offer an electrical return path to the chassis. Any current measured must not exceed 0.5 millamps. Reverse the instrument power cord plug in the outlet and repeat test.

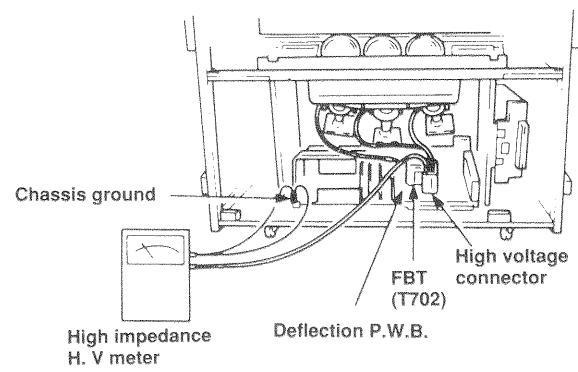

AC Leakage Test

ANY MEASUREMENTS NOT WITHIN THE LIMITS SPECIFIED HEREIN INDICATE A POTENTIAL SHOCK HAZARD THAT MUST BE ELIMINATED BEFORE RETURNING THE INSTRUMENT TO THE CUSTOMER OR BEFORE CONNECTING THE ANTENNA OR ACCESSORIES.

- e. **High Voltage** — This receiver is provided with a hold down circuit for clearly indicating that voltage has increased in excess of a predetermined value. Comply with all notes described in this Service Manual regarding this hold down circuit when servicing, so that this hold down circuit may correctly be operated.
 - f. **Serviceman Warning** — With minimum contrast and brightness, operating high voltage in this receiver is lower than **31.6kV**. In case any component having influence on high voltage is replaced, confirm that high voltage with minimum contrast and brightness is lower than **31.6kV**.
- To measure H.V. use a high impedance H.V. meter. Connect (-) to chassis earth and (+) to the CRT anode button. (See the following connection diagram.)

Note: Turn power switch off without fail before the connection to the anode button is made.

g. **X-radiation — TUBE:** The primary source of X-radiation in this receiver is the picture tube. The tube utilized for the above mentioned function in this chassis is specially constructed to limit X-radiation emissions.

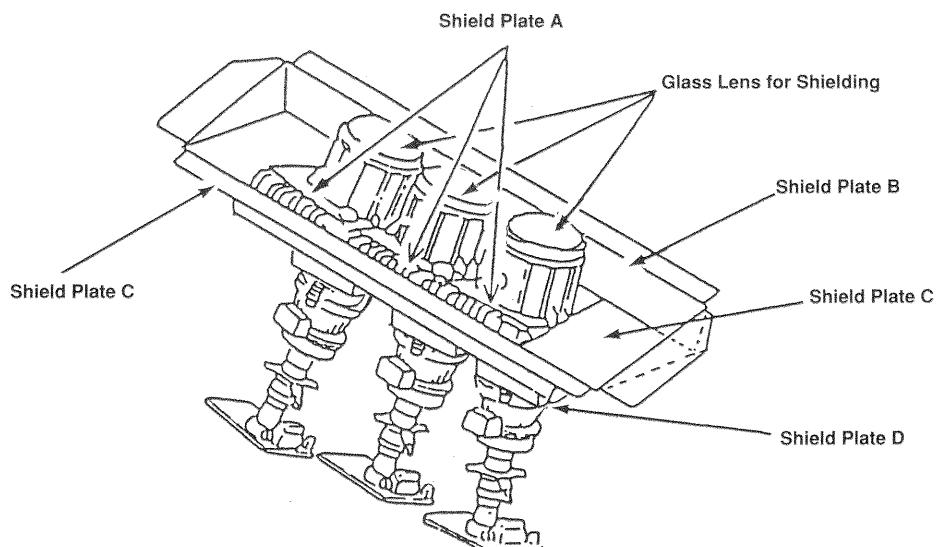

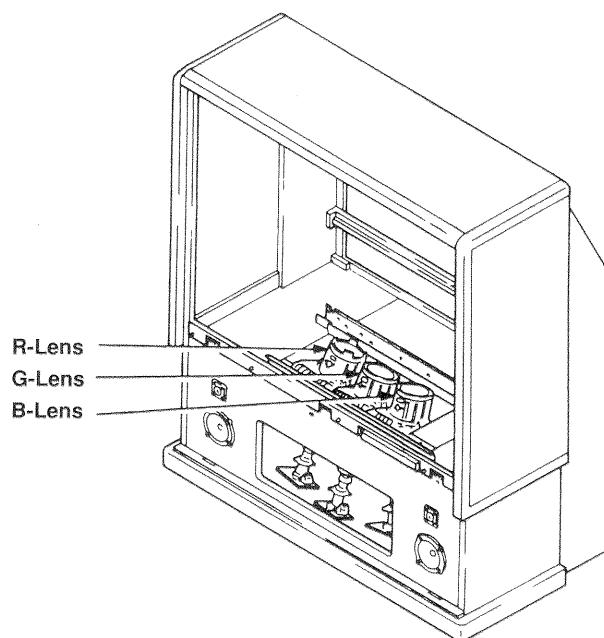

For continued X-radiation protection, the replacement tube must be the same type as the original, HITACHI approved type.

When troubleshooting and making test measurements in a receiver with a problem of excessive high voltage, avoid being unnecessarily close to the picture tube and the high voltage component.

Do not operate the chassis longer than is necessary to locate the cause of excessive voltage.

h. **X-Radiation Shield —**

- 1) This receiver is provided X-ray shield plates for the protection of X-radiation. Do not remove X-ray shield plates A, B, C, or D shown in Fig. 1 unnecessarily, when troubleshooting and/or making test measurements.
- 2) To prevent X-radiation, after replacement of picture tube and lens, confirm these components to be fixed correctly to bracket and cabinet, and not to be taken off easily.

Detailing X-radiation shield.
Fig. 1

2. Read and comply with all caution and safety-related notes on or inside the receiver cabinet, on the receiver chassis, or on the picture tube.
3. **Design Alteration Warning** — Do not alter or add to the mechanical or electrical design of this TV receiver. Design alterations and additions, including but not limited to, circuit modifications and the addition of items such as auxiliary audio and/or video output connectors, might alter the safety characteristics of this receiver and create a hazard to the user. Any design alterations or additions may void the manufacturer's warranty and may make you, the servicer, responsible for personal injury or property damage resulting therefrom.
4. **Picture Tube Implosion Protection Warning** — The picture tube in this receiver employs integral implosion protection. For continued implosion protection, replace the picture tube only with one of the same type number. Do not remove, install, or otherwise handle the picture tube in any manner without first putting on shatterproof goggles equipped with side shields. People not so equipped must be kept safely away while picture tubes are handled. Keep the picture tube away from your body. Do not handle the picture tube by its neck.
5. **Hot Chassis Warning** — **a.** Some TV receiver chassis are electrically connected directly to one conductor of the AC power cord and may be safely serviced without an isolation transformer only if the AC power plug is inserted so that the chassis is connected to the ground side of the AC power source. To confirm that the AC power plug is inserted correctly, with an AC voltmeter measure between the chassis and a known earth ground. If a voltage reading in excess of 1.0V is obtained, remove and reinsert the AC power plug in the opposite polarity and again measure the voltage potential between the chassis and a known earth ground. **b.** Some TV receiver chassis normally have 85V AC (RMS) between chassis and earth ground regardless of the AC plug polarity. These chassis can be safely serviced only with an isolation transformer inserted in the power line between the receiver and the AC power source, for both personnel and test equipment protection. **c.** Some TV receiver chassis have a secondary ground system in addition to the main chassis ground. This secondary ground system is not isolated from the AC power line. The two ground systems are electrically separated by insulating material that must not be defeated or altered.
6. Observe original lead dress. Take extra care to assure correct lead dress in the following areas: **a.** near sharp edges, **b.** near thermally hot parts — be sure that leads and components do not touch thermally hot parts, **c.** the AC supply, **d.** high voltage and **e.** antenna wiring. Always inspect in all areas for pinched, out-of-plane, or frayed wiring. Do not change spacing between components, and between components and the printed circuit board. Check AC power cord for damage.
7. Components, parts, and/or wiring that appear to have overheated or are otherwise damaged should be replaced with components, parts, or wiring that meet original specifications. Additionally, determine the cause of overheating and/or damage and, if necessary, take corrective action to remove any potential safety hazard.
8. **PRODUCT SAFETY NOTICE** — Many TV electrical and mechanical parts have special safety-related characteristics some of which are often not evident from visual inspection, nor can the protection they give necessarily be obtained by replacing them with components rated for higher voltage, wattage, etc. Parts that have special safety characteristics are identified Hitachi service data by shading on schematics and by a (Δ) in the parts list. Use of a substitute replacement that does not have the same safety characteristics as the recommended replacement part in Hitachi service data parts list might create shock, fire, and/or other hazards. Product safety is under review continuously and new instructions are issued whenever appropriate. For the latest information, always consult the appropriate current Hitachi service literature. A subscription to, or additional copies of Service literature may be obtained at a normal charge from Hitachi.

SERVICING PRECAUTIONS

CAUTION: Before servicing instruments covered by this service data and its supplements and addenda, read and follow the SAFETY PRECAUTIONS on page 19 of this publication.

NOTE: If unforeseen circumstances create conflict between the following servicing precautions and any of the safety precautions on page 19 of this publication, always follow the safety precautions. Remember: Safety First.

General Servicing Precautions

1. Always unplug the instrument AC power cord from the AC power source before:
 - a. Removing or reinstalling any component, circuit board, module, or any other instrument assembly.
 - b. Disconnecting or reconnecting any instrument electrical plug or other electrical connection.
 - c. Connecting a test substitute in parallel with an electrolytic capacitor in the instrument.
- Caution:** A wrong part substitution or incorrect polarity installation of electrolytic capacitors may result in an explosion hazard.
- d. Discharging the picture tube anode.
2. Test high voltage only by measuring it with an appropriate high voltage meter or other voltage measuring device (DVM, FETVOM, etc.) equipped with a suitable high voltage probe. Do not test high voltage by "drawing an arc." The H.V. Distribution Box has an internal 400MΩ resistor (bleeder resistor) connected from the high voltage to ground. After power is removed from the instrument the high voltage will discharge through the high voltage bleeder resistor. If the tubes have high voltage after power is removed, then the bleeder resistor is defective or the bleeder ground is disconnected.
3. Discharge the picture tube's anode at any of the R, G, or B outputs on the High Voltage distribution box only by (a) first connecting one end of an insulated clip lead to the degaussing or kine aquadag grounding system shield at the point where the picture tube socket ground lead is connected, and then (b) touch the other end of the insulated clip lead to the picture tube high voltage distribution box R, G, or B output, using an insulating handle to avoid personal contact with high voltage.
4. Do not spray chemical on or near this instrument or any of its assemblies.
5. Unless specified otherwise in these service data, clean electrical contacts by applying the following mixture to the contacts with a pipe cleaner, cotton-tipped stick or comparable nonabrasive applicator: 10% (by volume) Acetone and 90% (by volume) isopropyl alcohol (90%-99% strength). **Caution:** This is a flammable mixture. Unless specified otherwise in these service data, lubrication of contacts is not required.
6. Do not defeat any plug/socket B+ voltage interlocks with which instruments covered by this service data might be equipped.

7. Do not apply AC power to this instrument and/or any of its electrical assemblies unless all solid-state device heat sinks are correctly installed.
8. Always connect the test instrument ground lead to the appropriate instrument chassis ground before connecting the test instrument positive lead. Always remove the test instrument ground lead last.
9. Use with this instrument only the test fixtures specified in this service data.

CAUTION: Do not connect the test fixture ground strap to any heatsink in this instrument.

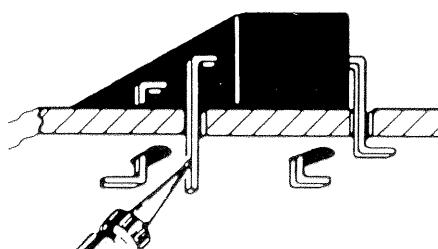

Electrostatically Sensitive (ES) Devices

Some semiconductor (solid state) devices can be damaged easily by static electricity. Such components commonly are called Electrostatically Sensitive (ES) Devices. Examples of typical ES devices are integrated circuits and some field-effect transistors and semiconductor "chip" components. The following techniques should be used to help reduce the incidence of component damage caused by static electricity.

1. Immediately before handling any semiconductor component or semiconductor-equipped assembly, drain off any electrostatic charge on your body by touching a known earth ground. Alternatively, obtain and wear a commercially available discharging wrist strap device, which should be removed for potential shock reasons prior to applying power to the unit under test.
 2. After removing an electrical assembly equipped with ES devices, place the assembly on a conductive surface such as aluminum foil, to prevent electrostatic charge buildup or exposure of the assembly.
 3. Use only a grounded-tip soldering iron to solder or unsolder ES devices.
 4. Use only an anti-static type solder removal device. Some solder removal devices not classified as "anti-static" can generate electrical charges sufficient to damage ES devices.
 5. Do not use freon-propelled chemicals. These can generate electrical charges sufficient to damage ES devices.
 6. Do not remove a replacement ES device from its protective package until immediately before you are ready to install it. (Most replacement ES devices are packaged with leads electrically shorted together by conductive foam, aluminum foil or comparable conductive material.)
 7. Immediately before removing the protective material from the leads of a replacement ES device, touch the protective material to the chassis or circuit assembly into which the device will be installed.
- CAUTION:** Be sure no power is applied to the chassis or circuit, and observe all other safety precautions.
8. Minimize bodily motions when handling unpackaged replacement ES devices. (Otherwise harmless motion such as the brushing together of your clothes fabric or the lifting of your foot from a carpeted floor can generate static electricity sufficient to damage an ES device.)

General Soldering Guidelines

1. Use a grounded-tip, low-wattage soldering iron and appropriate tip size and shape that will maintain tip temperature within the range 500°F to 600°F.
2. Use an appropriate gauge of resin-core solder composed of 60 parts tin/40 parts lead.
3. Keep the soldering iron tip clean and well tinned.
4. Thoroughly clean the surfaces to be soldered. Use a small wire-bristle (0.5 inch or 1.25 cm) brush with a metal handle. Do not use freon-propelled spray-on cleaners.
5. Use the following unsoldering technique.
 - a. Allow the soldering iron tip to reach normal temperature (500°F to 600°F).
 - b. Heat the component lead until the solder melts. Quickly draw away the melted solder with an anti-static, suction-type solder removal device or with solder braid.
- CAUTION:** Work quickly to avoid overheating the circuit board printed foil.
6. Use the following soldering technique.
 - a. Allow the soldering iron tip to reach normal temperature (500°F to 600°F).
 - b. First, hold the soldering iron tip and solder strand against the component lead until the solder melts.
 - c. Quickly move the soldering iron tip to the junction of the component lead and the printed circuit foil, and hold it there only until the solder flows onto and around both the component lead and the foil.
- CAUTION:** Work quickly to avoid overheating the circuit board printed foil or components.
- d. Closely inspect the solder area and remove any excess or splashed solder with a small wire-bristle brush.

Use Soldering Iron to Pry Leads

IC Removal/Replacement

Some Hitachi unitized chassis circuit boards have slotted holes (oblong) through which the IC leads are inserted and then bent flat against the circuit foil. When holes are the slotted type, the following technique should be used to remove and replace the IC. When working with boards using the familiar round hole, use the standard technique as outlined in paragraphs 5 and 6 above.

Removal

1. Desolder and straighten each IC lead in one operation by gently prying up on the lead with the soldering iron tip as the solder melts.
2. Draw away the melted solder with an anti-static suction-type solder removal device (or with solder braid) before removing the IC.

Replacement

1. Carefully insert the replacement IC in the circuit board.
2. Carefully bend each IC lead against the circuit foil pad and solder it.
3. Clean the soldered areas with a small wire-bristle brush. (It is not necessary to reapply acrylic coating to the areas.)

"Small-signal" Discrete Transistor Removal/Replacement

1. Remove the defective transistor by clipping its leads as close as possible to the component body.
2. Bend into a "U" shape the end of each of three leads remaining on the circuit board.
3. Bend into a "U" shape the replacement transistor leads.
4. Connect the replacement transistor leads to the corresponding leads extending from the circuit board and crimp the "U" with long nose pliers to insure metal to metal contact, then solder each connection.

Power Output Transistor Devices Removal/Replacement

1. Heat and remove all solder from around the transistor leads.
2. Remove the heatsink mounting screw (if so equipped).
3. Carefully remove the transistor from the circuit board.
4. Insert new transistor in circuit board.
5. Solder each transistor lead, and clip off excess lead.
6. Replace heatsink.

Diode Removal/Replacement

1. Remove defective diode by clipping its leads as close as possible to diode body.
2. Bend the two remaining leads perpendicularly to the circuit board.
3. Observing diode polarity, wrap each lead out of the new diode around the corresponding lead on the circuit board.
4. Securely crimp each connection and solder it.
5. Inspect (on the circuit board copper side) the solder joints of the two "original" leads. If they are not shiny, reheat them and, if necessary, apply additional solder.

Fuses and Conventional Resistor Removal/Replacement

1. Clip each fuse or resistor lead at top of circuit board hollow stake.
2. Securely crimp leads of replacement component around stake 1/8 inch from top.
3. Solder the connections.

CAUTION: Maintain original spacing between the replaced component and adjacent components and the circuit board, to prevent excessive component temperatures.

Circuit Board Foil Repair

Excessive heat applied to the copper foil of any printed circuit board will weaken the adhesive that bonds the foil to the circuit board, causing the foil to separate from, or "lift-off," the board. The following guidelines and procedures should be followed whenever this condition is encountered.

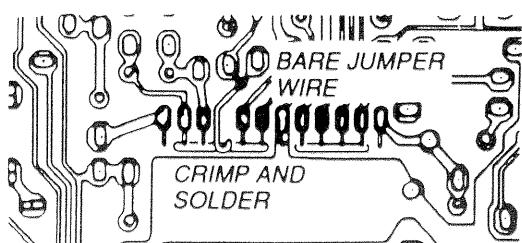

In Critical Copper Pattern Areas

High component/copper pattern density and/or special voltage/current characteristics make the spacing and integrity of copper pattern in some circuit board areas more critical than in others. The circuit foil in these areas is designated as Critical Copper Pattern and is identified and illustrated in this service data in the section titled Safety Related Copper Pattern (see table of contents for page number). Because Critical Copper Pattern requires special soldering techniques to ensure the maintenance of reliability and safety standards, contact your Hitachi personnel.

At IC Connections

To repair defective copper pattern at IC connections, use the following procedure to install a jumper wire on the copper pattern side of the circuit board. (Use this technique only on IC connections.)

1. Carefully remove the damaged copper pattern with a sharp knife. (Remove only as much copper as absolutely necessary.)
2. Carefully scratch away the solder resist and acrylic coating (if used) from the end of the remaining copper pattern.

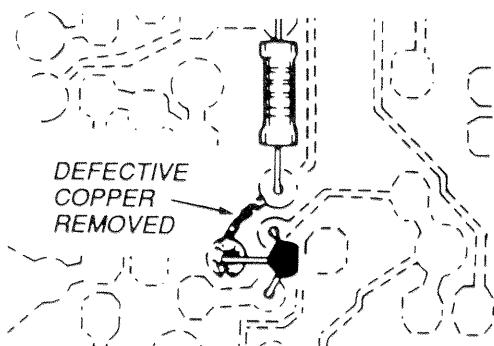

Install Jumper Wire and Solder

3. Bend a small "U" in one end of a small-gauge jumper wire and carefully crimp it around the IC pin. Solder the IC connection.

4. Route the jumper wire along the path of the cut-away copper pattern and let it overlap the previously scraped end of the good copper pattern. Solder the overlapped area, and clip off any excess jumper wire.

At Other connections

Use the following technique to repair defective copper pattern at connections other than IC Pins. This technique involves the installation of a jumper wire on the component side of the circuit board.

Insulated Jumper wire

1. Remove the defective copper pattern with a sharp knife. Remove at least 1/4 inch of copper, to ensure that a hazardous condition will not exist if the jumper wire opens.
2. Trace along the copper pattern from both sides of the pattern break and locate the nearest component that is directly connected to the affected copper pattern.
3. Connect insulated 20-gauge jumper wire from the lead of the nearest component on one side of the pattern break to the lead of the nearest component on the other side. Carefully crimp and solder the connections.

CAUTION: Be sure the insulated jumper wire is dressed so that it does not touch components or sharp edges.

Frequency Synthesis (FS) Tuning Systems

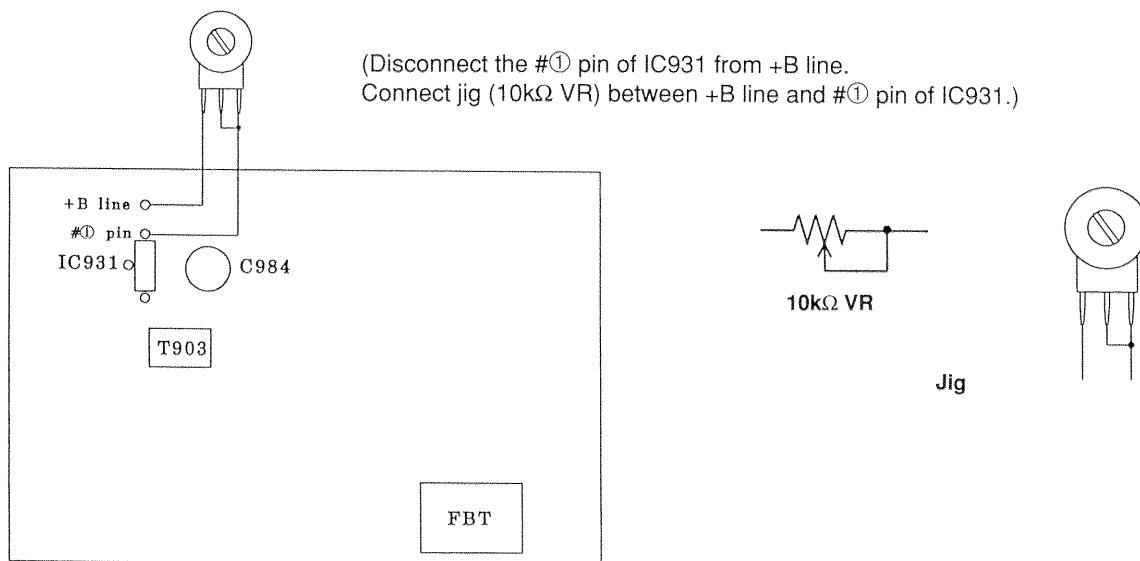

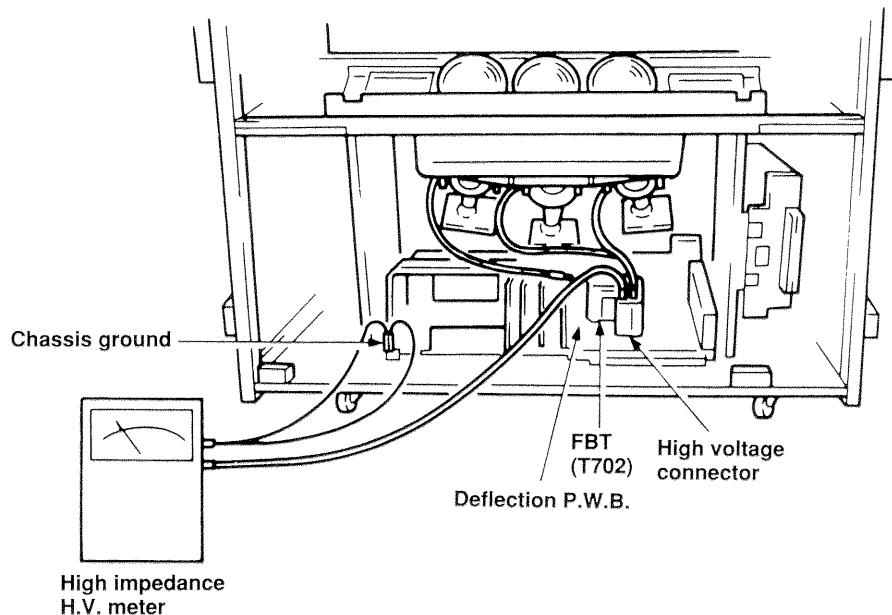

1. Always unplug the instrument AC power cord before disconnecting or reconnecting FS tuning system cables and before removing or reinserting FS tuning system modules.
2. The FS tuner must never be disconnected from the FS tuning control module while power is applied to the instrument.
3. When troubleshooting intermittent problems that might be caused by defective cable connection(s) to the FS tuning system, remove the instrument AC power as soon as the defective connector is found and finish confirming the bad connection with a continuity test. This procedure will reduce the probability of electrical overstress of the FS system semi-conductor components.

TECHNICAL CAUTIONS

High Voltage limiter circuit operation check.

1. Turn off TV and connect jig as shown in Figure 2. Adjust jig fully counter-clockwise for minimum resistance.
2. Set the AC input to 120V AC and turn on TV.
3. Confirm test pattern on CRT is a usable picture, then slowly adjust jig until the picture disappears and TV shuts down.

4. When the limiter circuit is operating properly, High Voltage will be less than 35.5kV at 0.6mA when TV shuts down.
5. Turn off set immediately after checking circuit operation.
6. Unplug set for one minute to reset shutdown circuit.
Remove jig and voltmeter.

GENERAL INFORMATION

The diagram illustrates the layout of the Control Panel. It features a central horizontal row of buttons: AVX, VOLUME, CHANNEL, and POWER. Above these buttons are four small circles with arrows pointing up, down, left, and right respectively. To the left of the panel is a large oval containing a smaller oval, labeled 'TV/VIDEO SOURCE SELECTOR'. To the right is a vertical rectangular area containing two circular sensors labeled 'REMOTE CONTROL SENSOR' and 'ARTIFICIAL INTELLIGENCE SENSOR'.

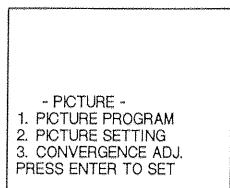

Control Panel Fig. 3

Rear Connections Panel
Fig. 4

ADJUSTING FOR PICTURE AND SOUND FUNCTIONS

Press MENU, 2 ENTER on the remote control to display the -PICTURE- functions.

PICTURE PROGRAM is for preferred settings — contrast, color, etc.

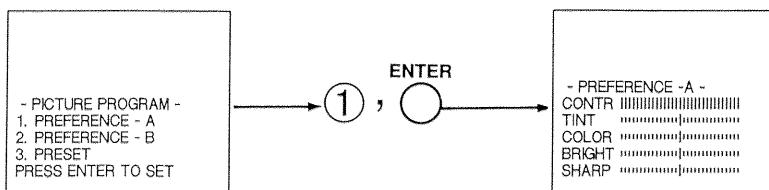

PICTURE SETTING is used to improve the picture quality.

CONVERGENCE ADJ. is used to align the TV color picture tubes (red, green, blue) to produce a clear picture.

• PICTURE PROGRAM

There are two sets of preferred settings, PREFERENCE-A, PREFERENCE-B or use the factory PRESET settings.

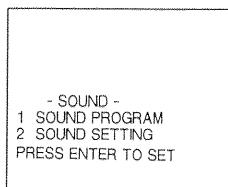

Press MENU, 2, ENTER, 1, ENTER to select the PICTURE PROGRAM.

Press the CURSOR buttons to select and make adjustments.

- | | |
|------------|---|
| CONTRAST | — Use this function to change the contrast between black and white levels in the picture. This adjustment will only affect the picture when the PICTURE SETTING AI is OFF. See page XX. |
| TINT | — Use this function to adjust flesh tones so that they appear natural. |
| COLOR | — Use this function to adjust the level of color in the picture. |
| BRIGHTNESS | — Use this function to adjust overall picture brightness. |
| SHARPNESS | — Use this function to adjust the amount of fine detail in the picture. This adjustment will only affect the picture when PICTURE SETTING AI is OFF. |

Press MENU, 3 ENTER on the remote control to display the -SOUND- functions.

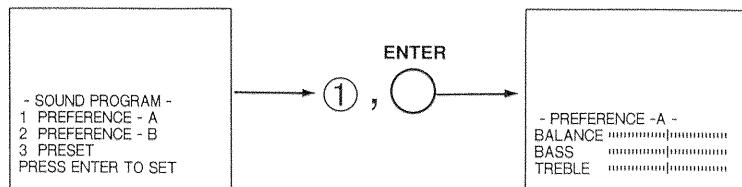

SOUND PROGRAM is for preferred settings — balance, bass and treble.
SOUND SETTING is used to improve the sound quality.

• **SOUND PROGRAM**

There are two sets of preferred settings, PREFERENCE-A, PREFERENCE-B or use the factory PRESET settings.

Press MENU, 3, ENTER, 1, ENTER to select the SOUND PROGRAM.

Press the CURSOR buttons to select and make adjustments.

BALANCE — This function will control the left, right balance of the TV internal speakers, the AUDIO TO HI-FI output and the surround speakers. The balance control is also found in the DOLBY TEST function.

BASS — This function controls the low frequency audio to all speakers.

TREBLE — This function controls the high frequency to all speakers.

SELF CHECK REPAIR CODES

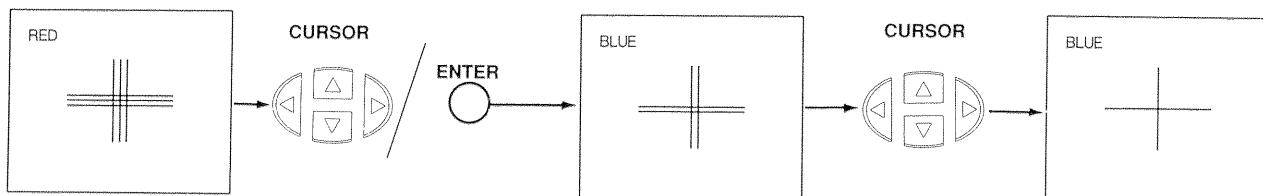

Press the AVX and POWER buttons on the control panel at the same time.

| CODE | DETECTION CONTENTS | DETECTION TIME | REMARK |
|------|---|------------------------|---|
| 40 | Abnormal horizontal deflection | --- | --- |
| 41 | Flyback Transformer loading on 12V line | --- | --- |
| 50 | Power Relay off | --- | Abnormal condition causing relay to turn off |
| 10 | Check for PLL lock | Not locked in 2 sec. | During selection time |
| 11 | Check for AFC operation | Not finished in 2 sec. | During selection time |
| 60 | Check for AC input | At uP reset time | AC input (50/60Hz) not detected at reset time |
| 31 | Check IC0001 operation | At uP reset time | Check for out of range operation |

Note: Code 10 or 11 may appear if TV is turned on without an antenna source connected.

CONVERGENCE ADJUSTMENT

Press MENU, 2, ENTER, 3, ENTER on the remote control to display the CONVERGENCE ADJUSTMENT.

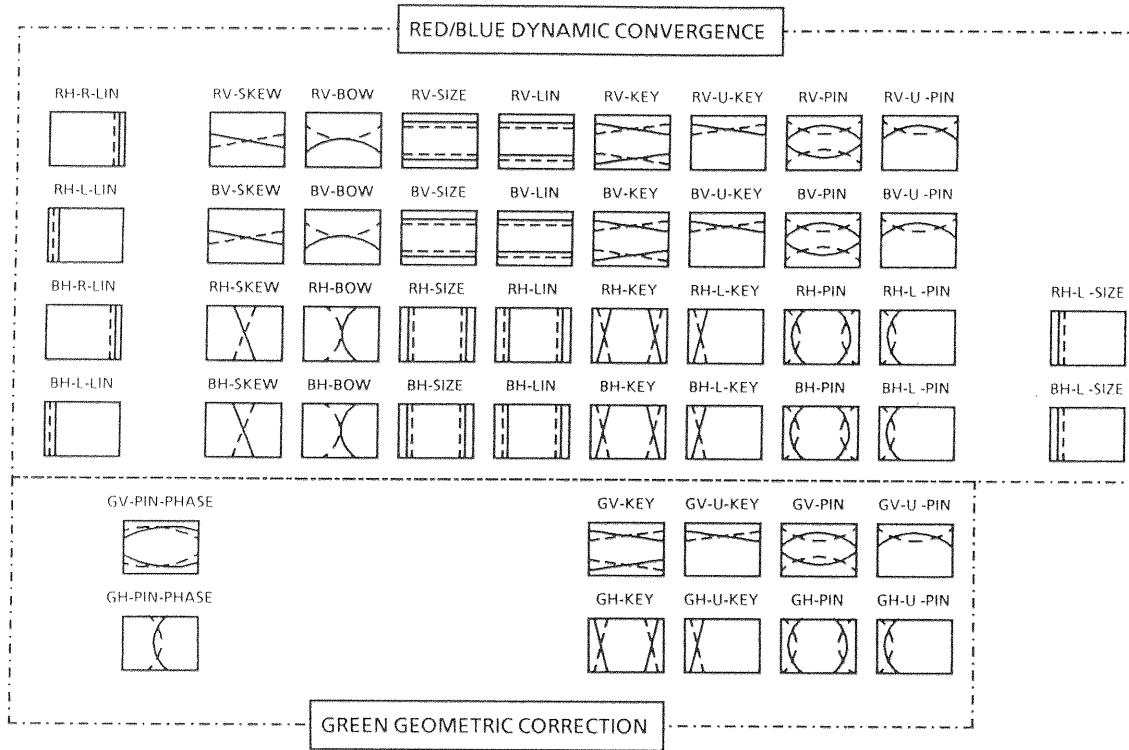

Press the CURSOR ▲, ▼ to move the color displayed up or down.

Press the CURSOR ◀, ▶ to move the color displayed left or right.

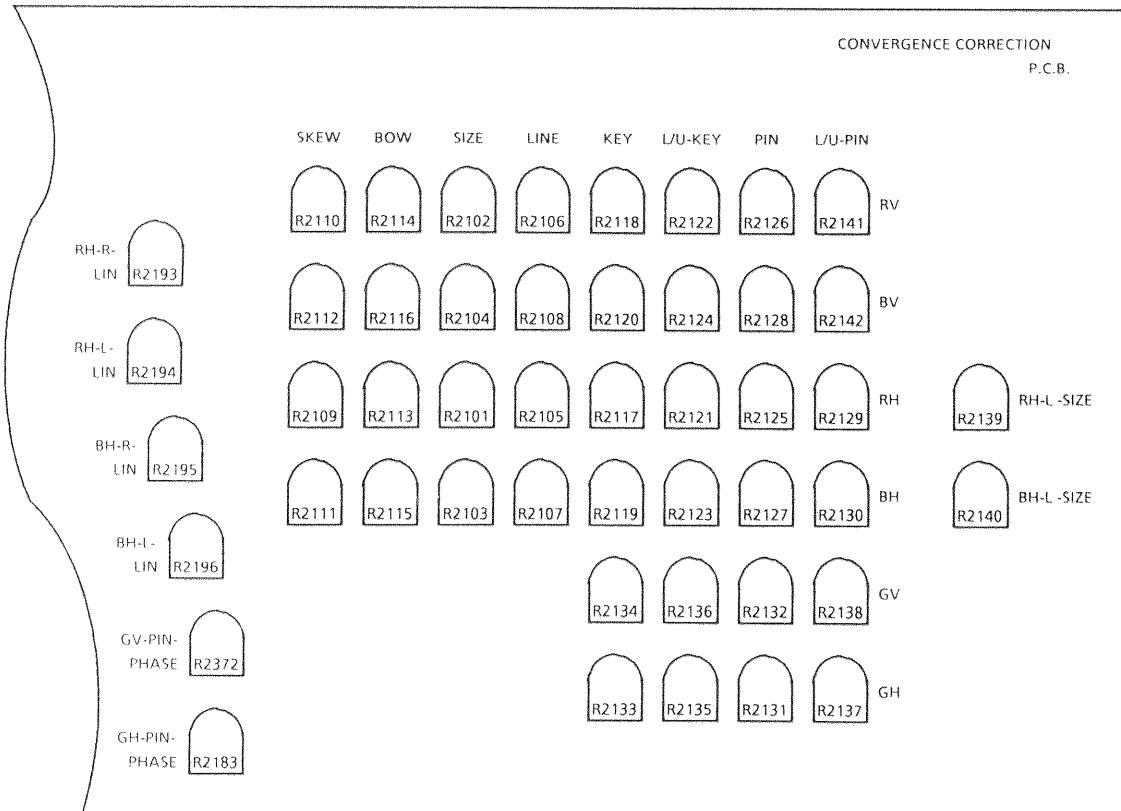

Press ENTER to change the color.

Press MENU to exit.

Dynamic Convergence

Layout of the Adjustment VR

CAUTIONS WHEN CONNECTING/DISCONNECTING THE HV CONNECTOR

Perform the following when the HV connector (anode connector) is removed or inserted for CPT replacement, etc.

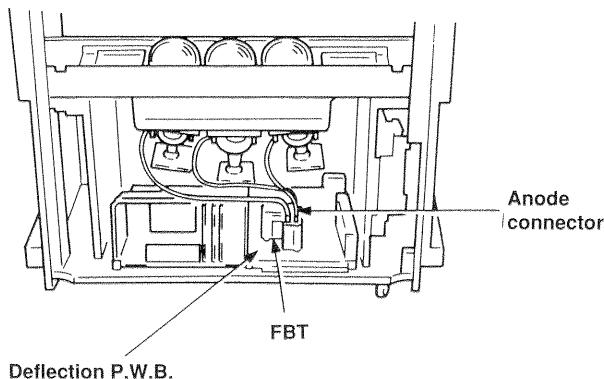

Fig. 5

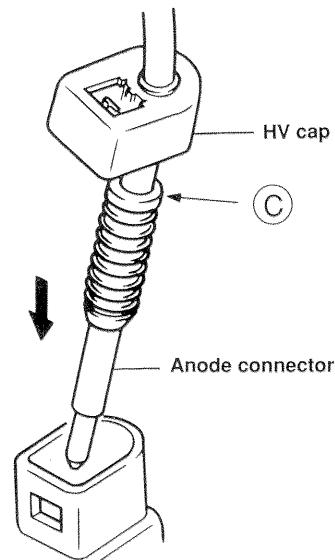

Fig. 7

During Removal

1. Insert a small flat-bladed screwdriver (adjustment screwdriver: 5-7 mm wide and 0.2-0.3 mm thick) into section (A) in Fig. 6 and then push it in the direction of arrow (B). The lock will release with a click. (The state in Fig. 8 (1) will change to that in Fig. 8 (2).)

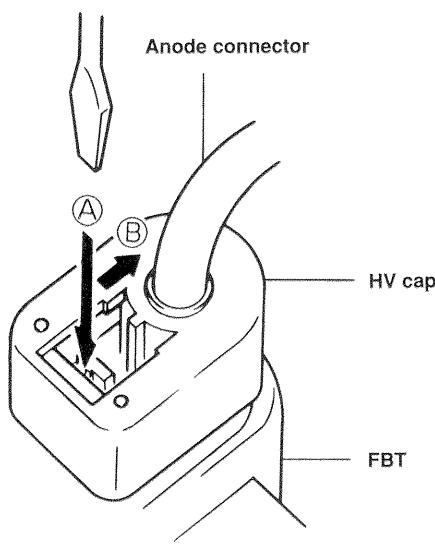

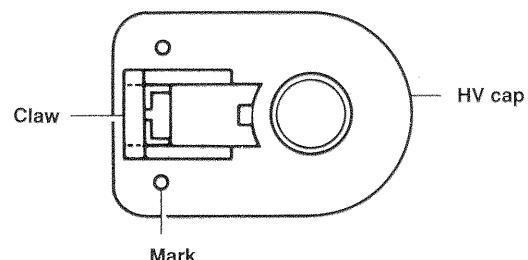

Fig. 6

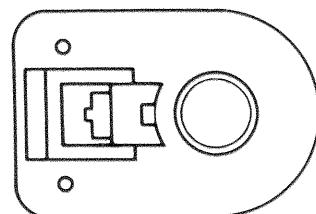

2. Remove the HV cap and remove the anode connector (Fig. 7).

During Insertion

1. Insert the anode connector deep into the FBT (to section (C) in Fig. 7) and then push the HV cap into the FBT until it clicks.
2. Make sure the connector is securely inserted. (Check that the claw is at the mark on the HV cap shown as in Fig. 8 (1).)

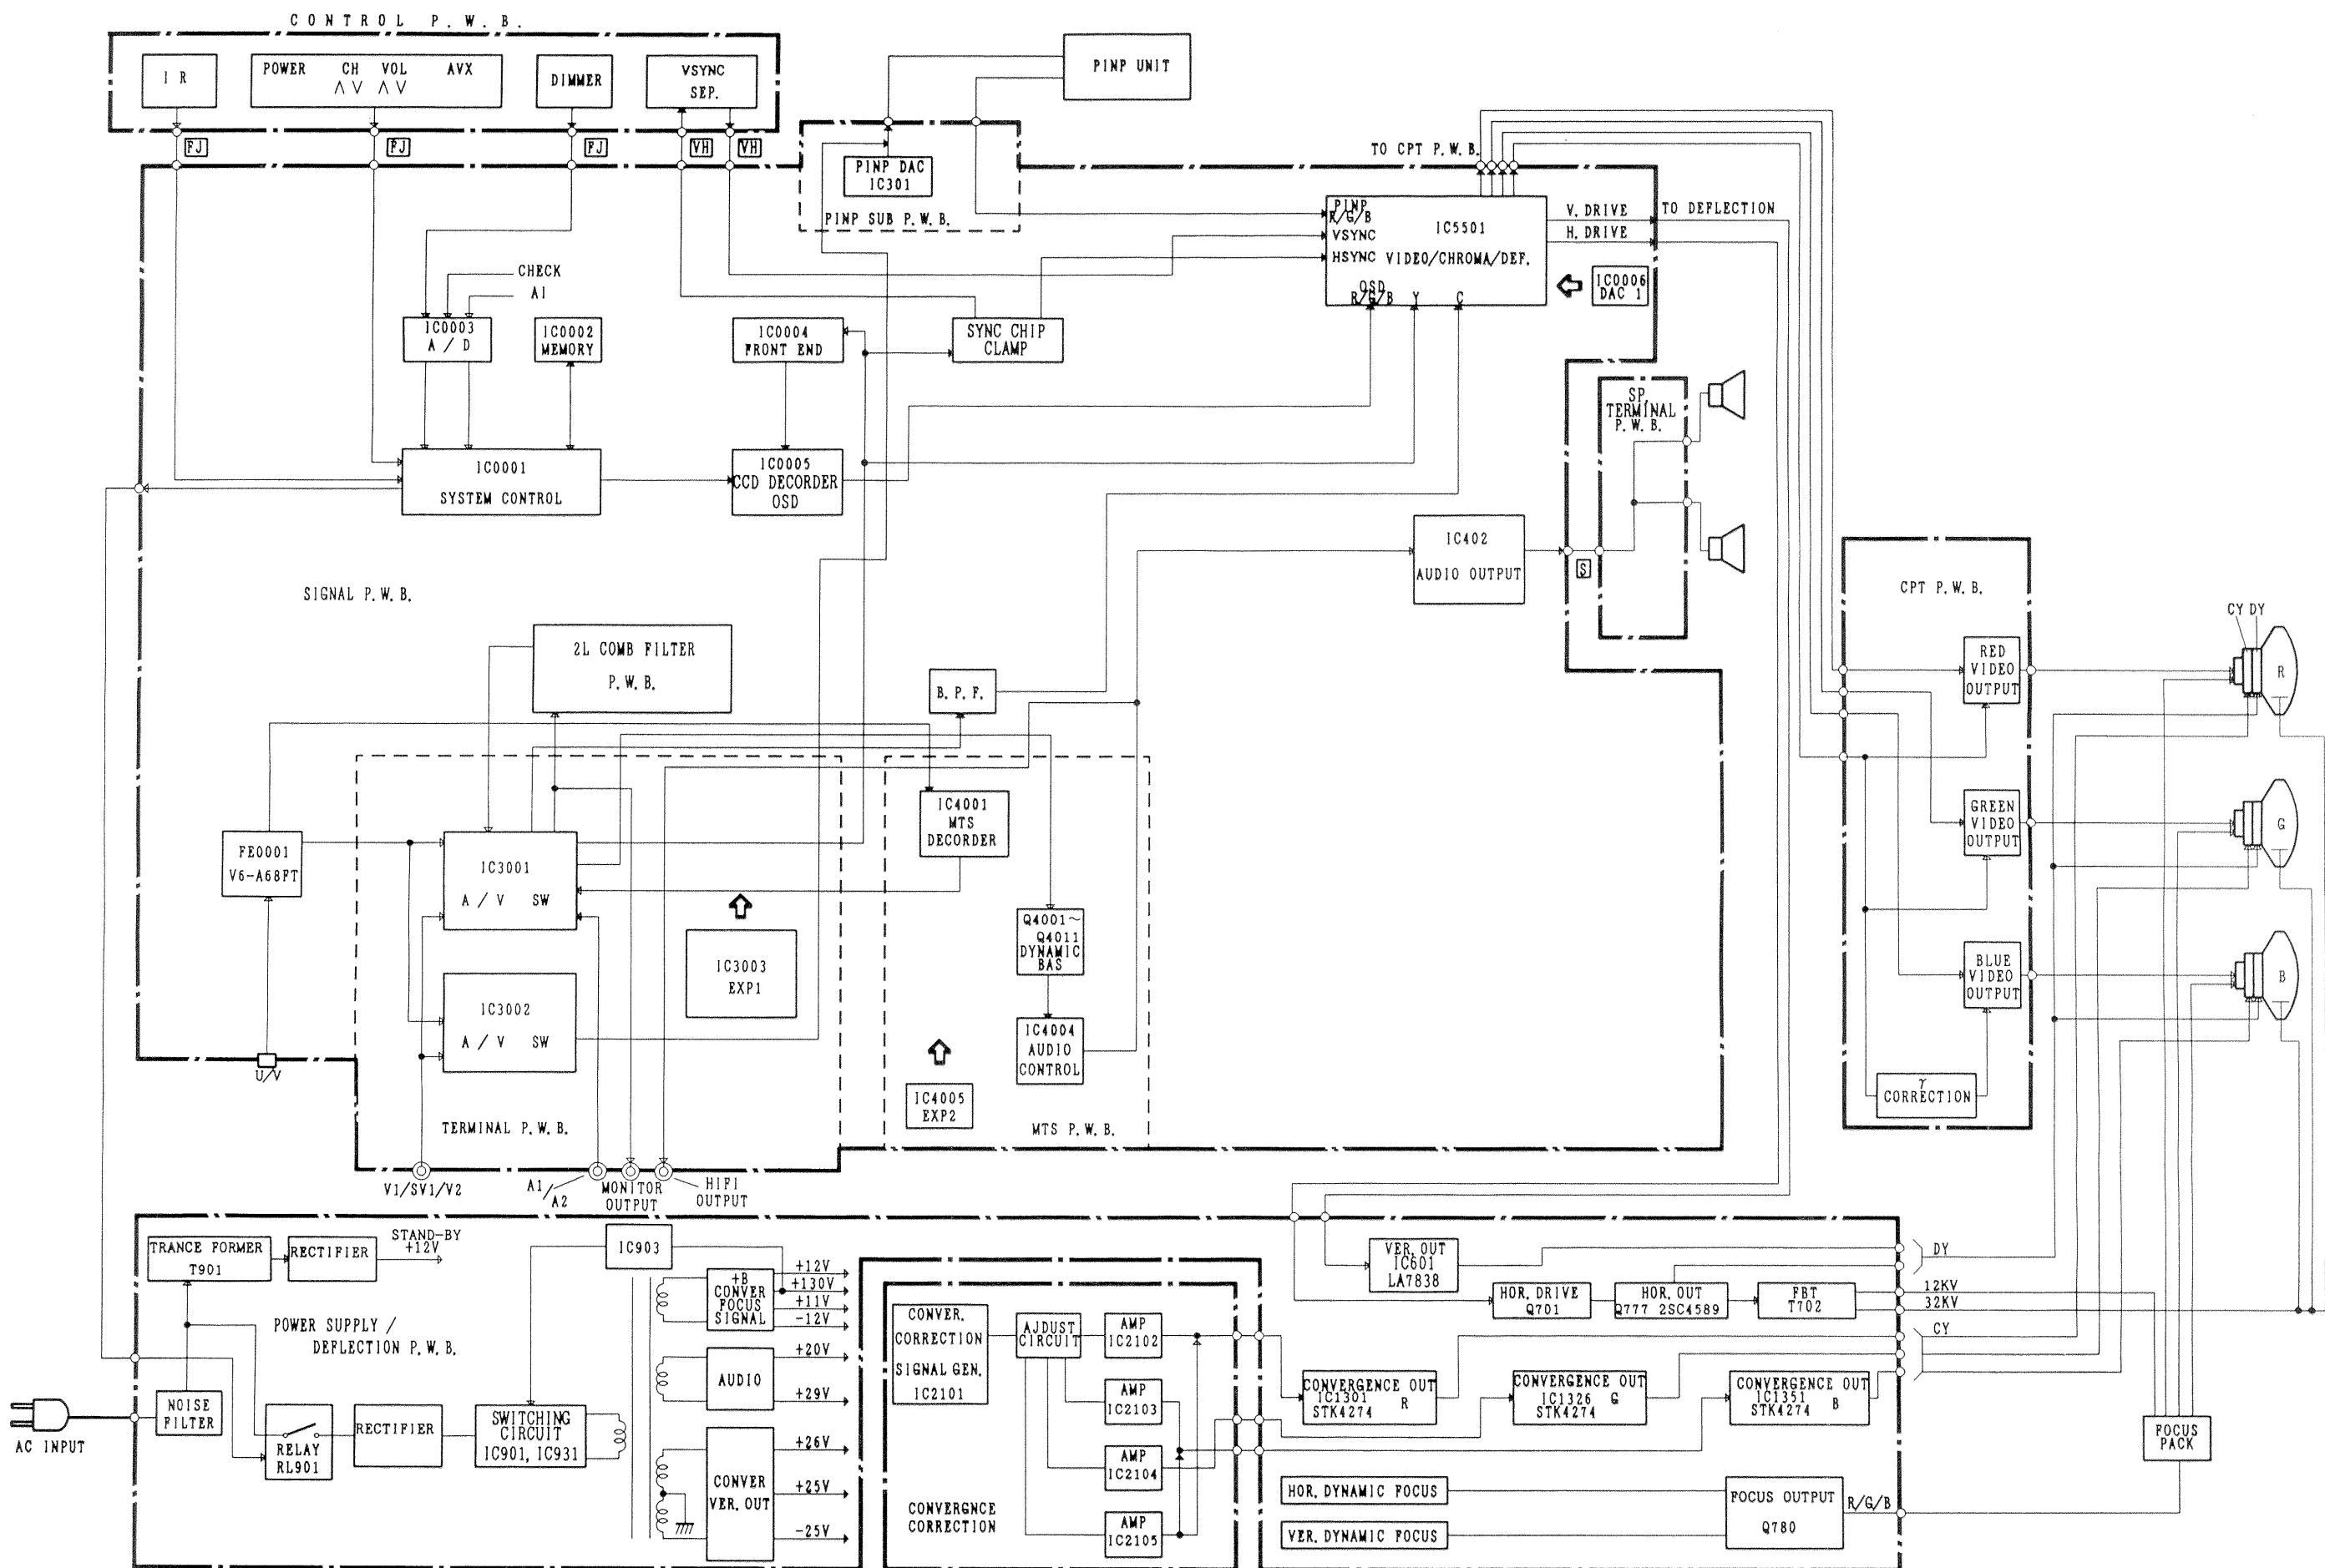

- (1) Lock on
(When connector is inserted)

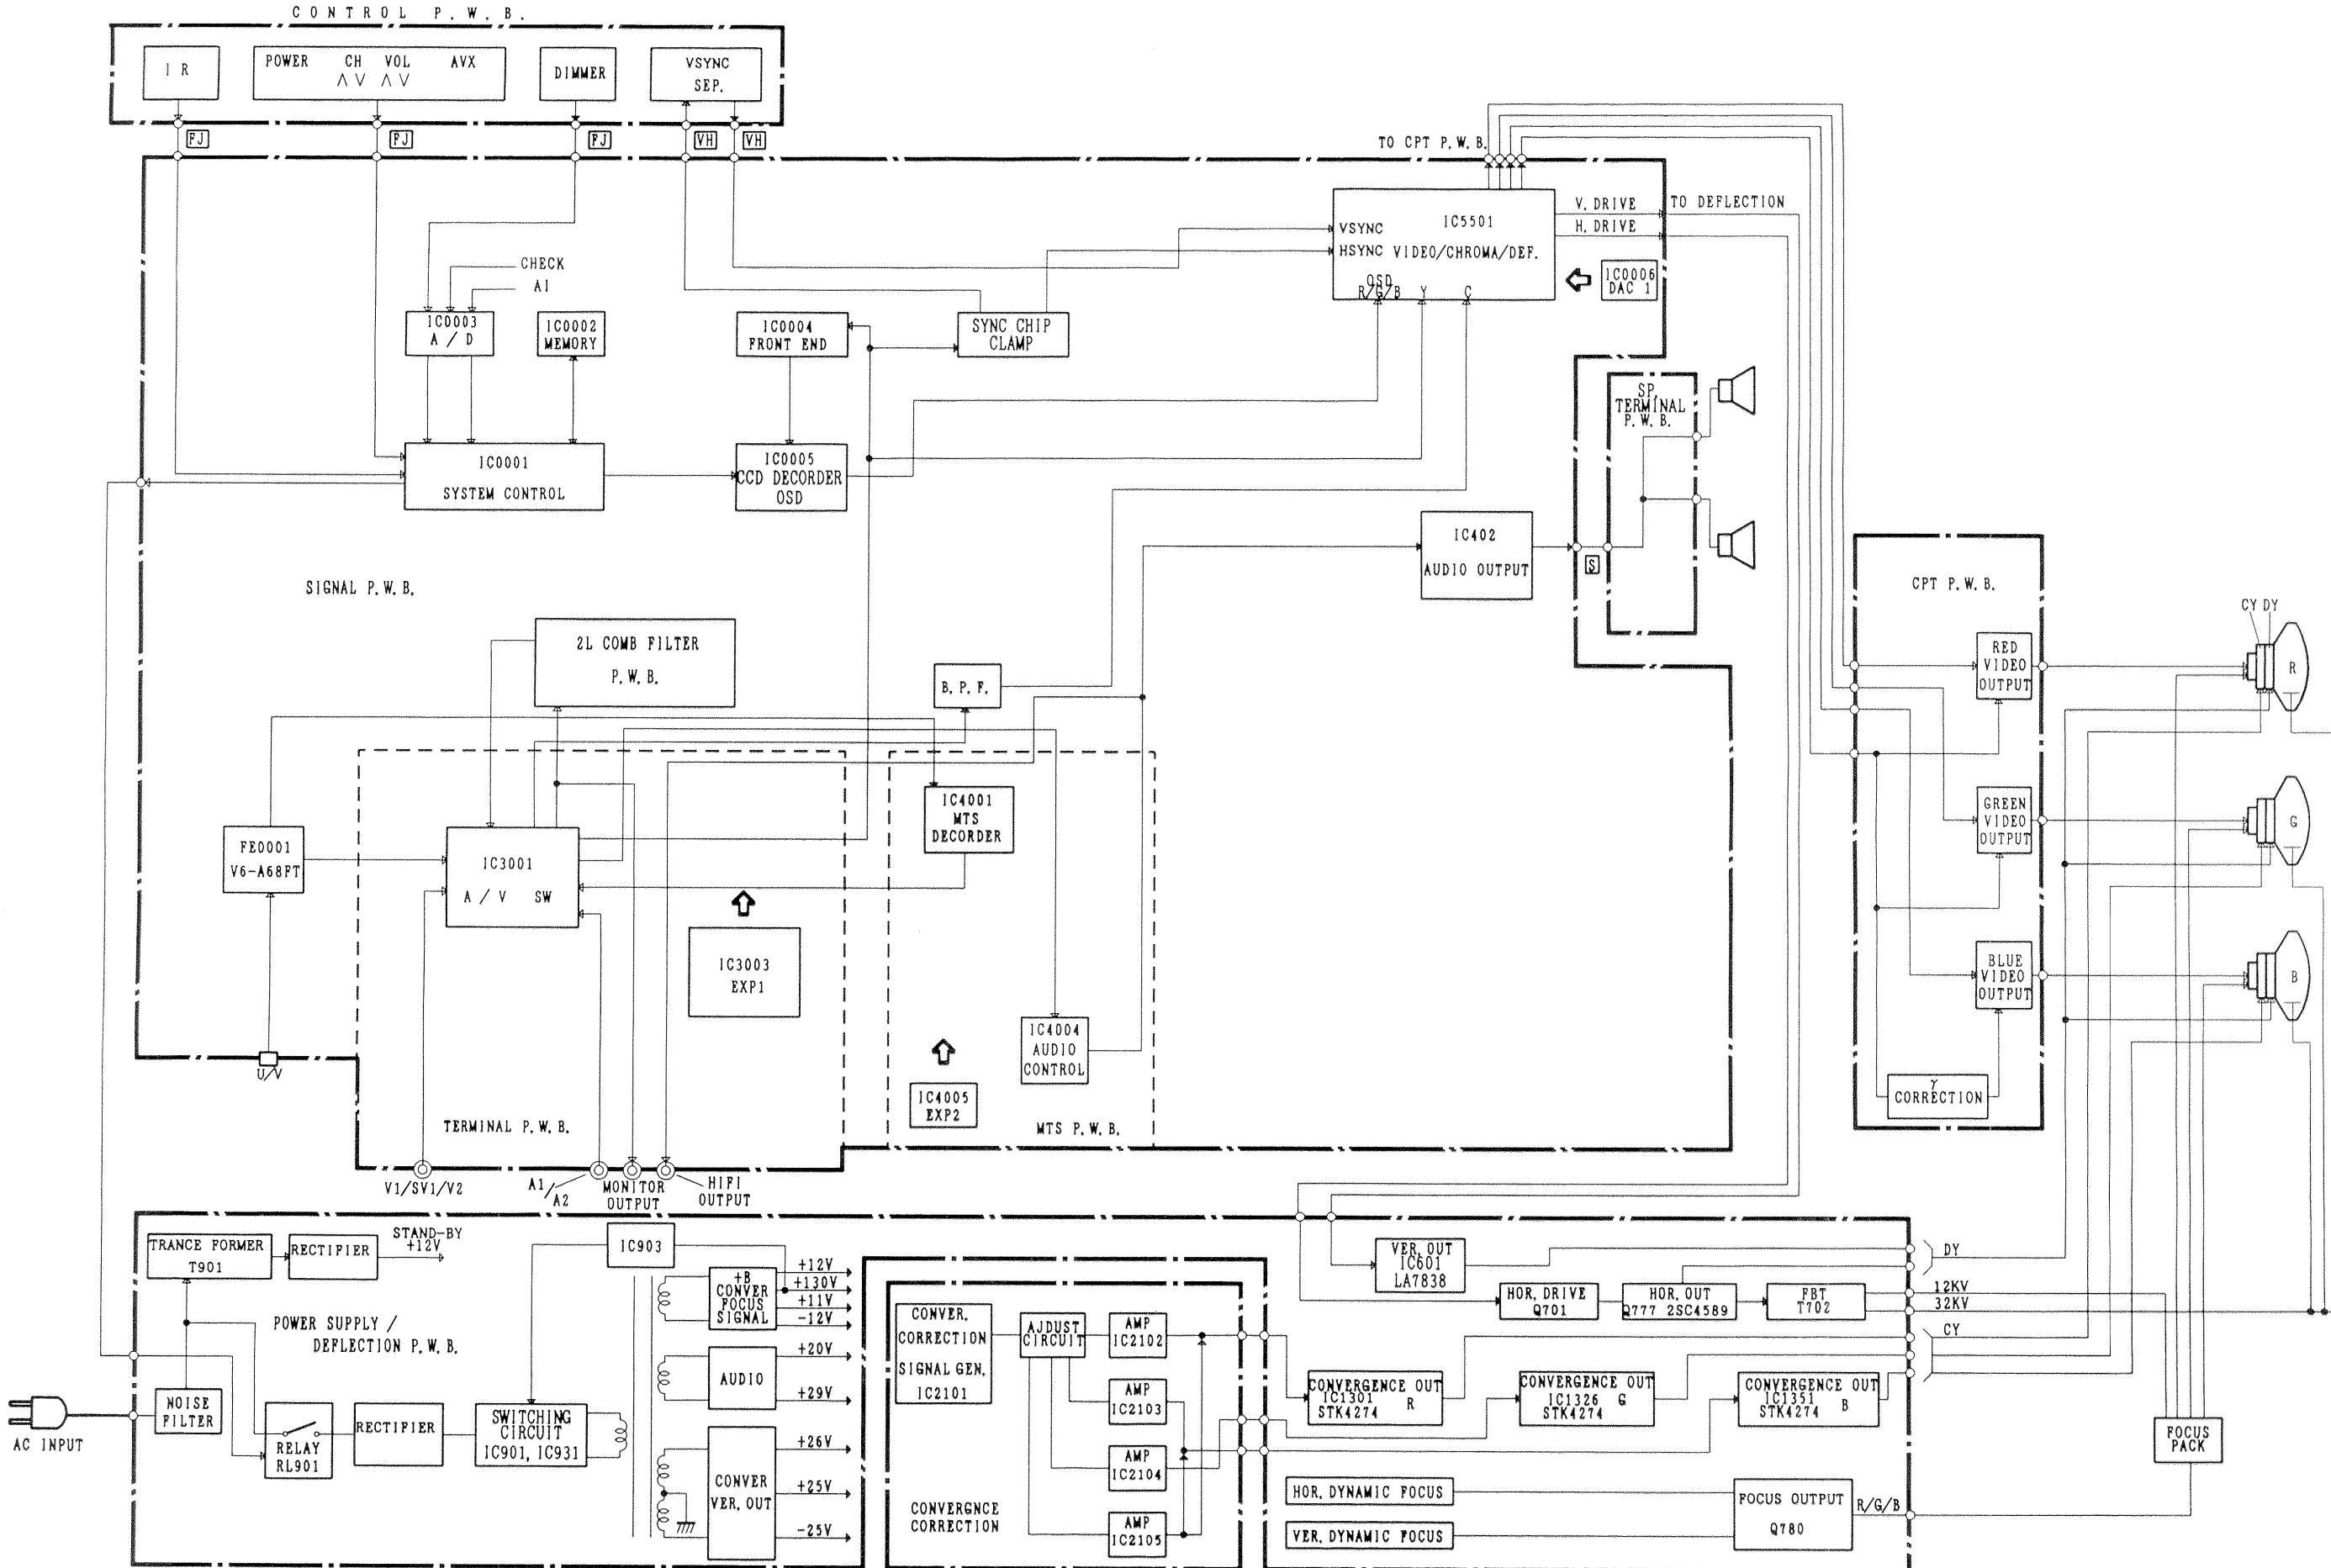

- (2) Release
(When connector is removed)

Note: Some parts may appear different than those shown in the exploded view. When ordering, refer to the REPLACEMENT PARTS LIST for correct part number. Since this Service Manual covers several models, use care to select the correct part for the model being serviced.

EXPLODED VIEW / VUE SUPERPOSE (1 / 3)
(50ES1B / 50ES1K)

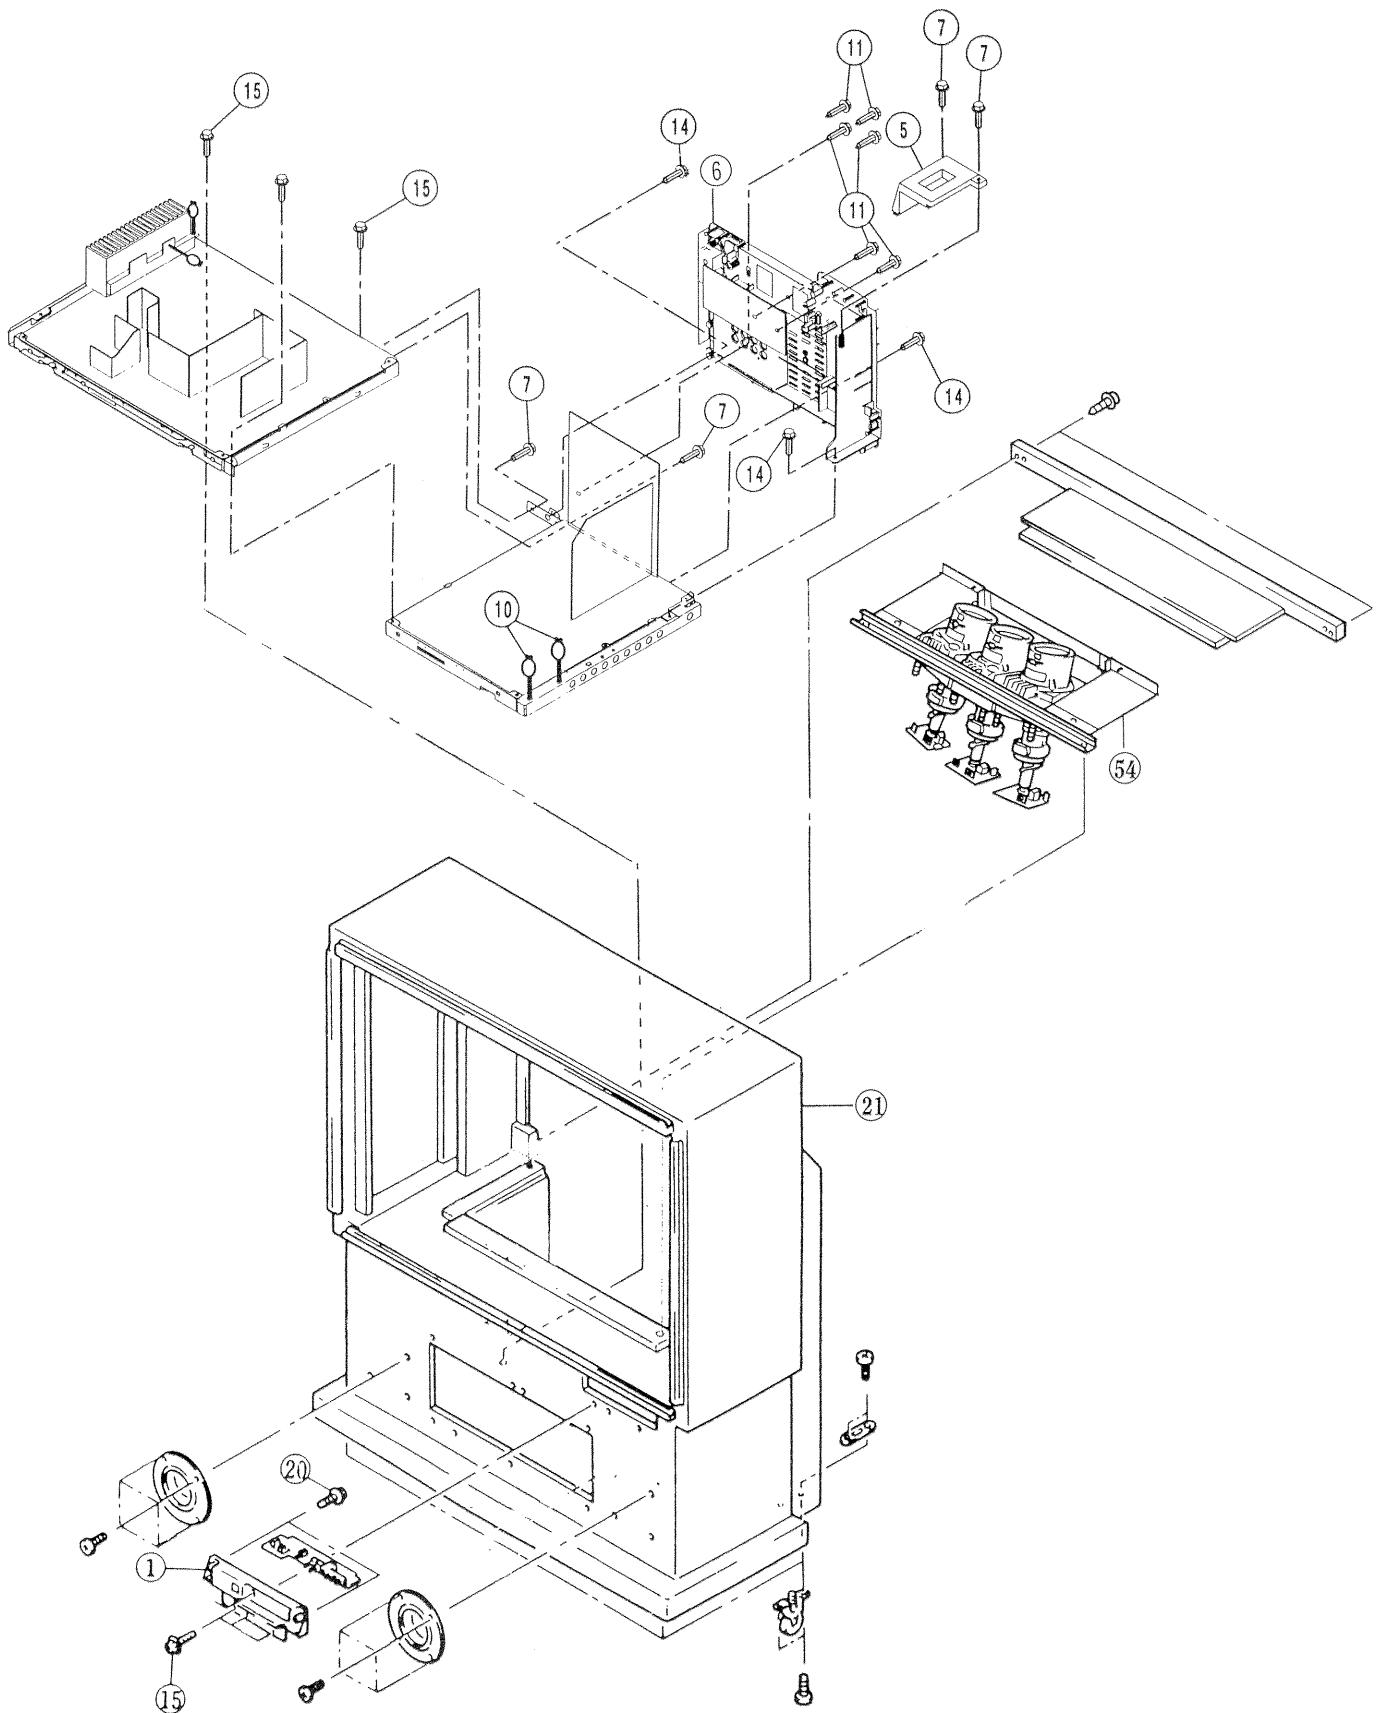

Note: Some parts may appear different than those shown in the exploded view. When ordering, refer to the REPLACEMENT PARTS LIST for correct part number. Since this Service Manual covers several models, use care to select the correct part for the model being serviced.

EXPLODED VIEW / VUE SUPERPOSE (1 / 3)
(46EX3B/3BS / 46EX4K/4KS)

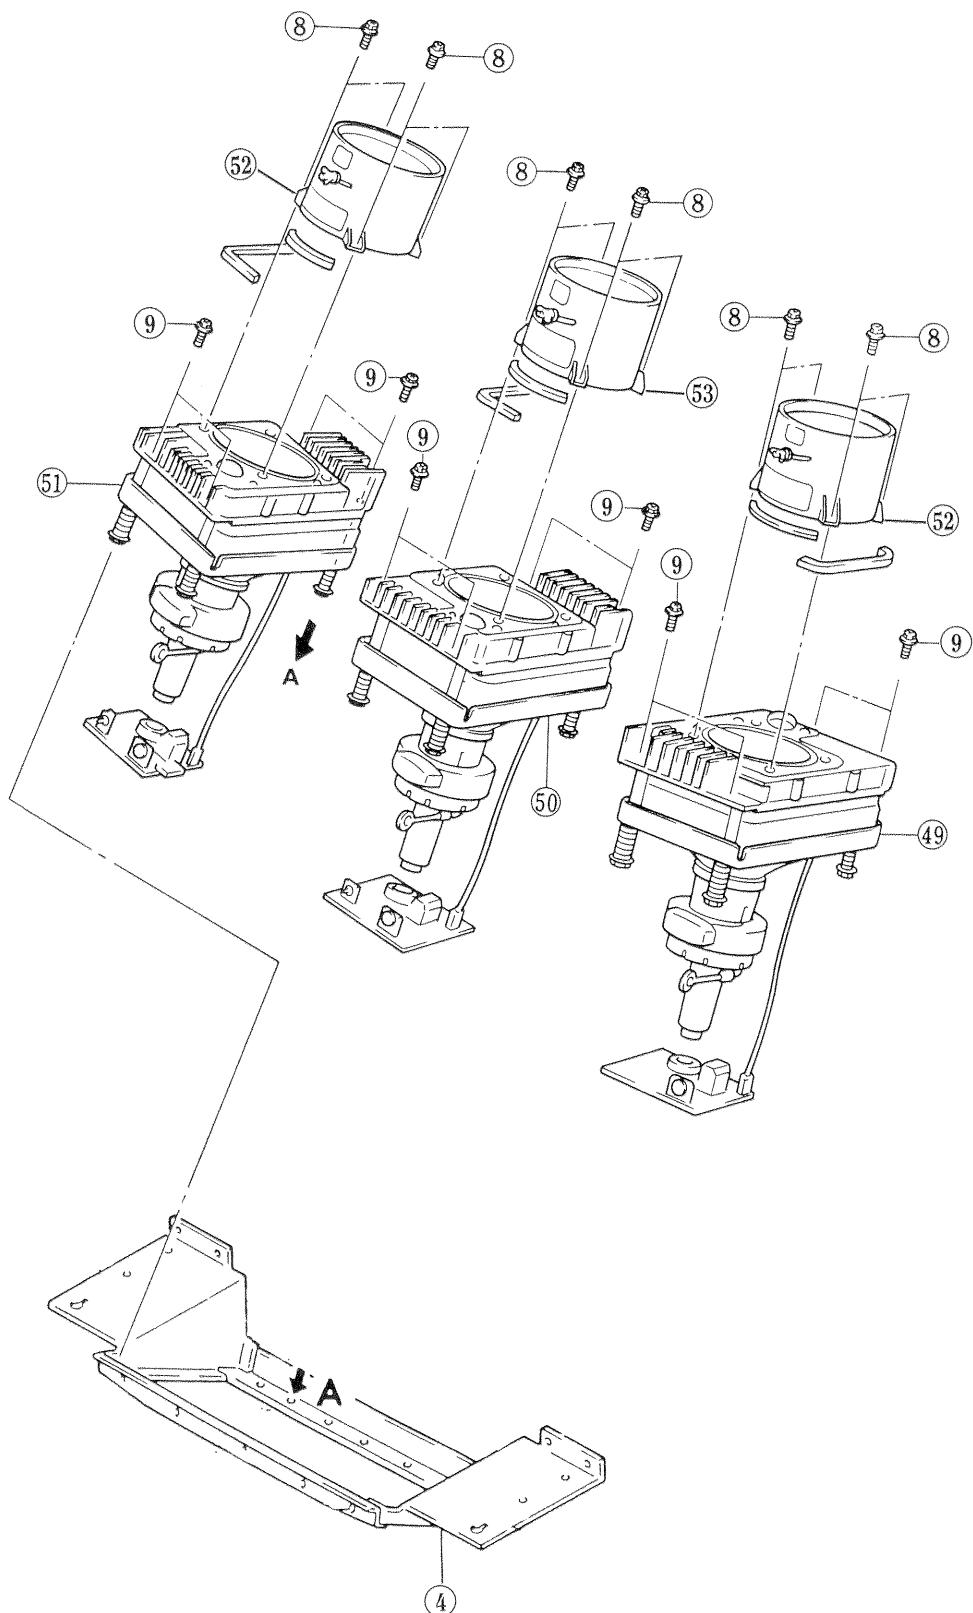

Note: Some parts may appear different than those shown in the exploded view. When ordering, refer to the REPLACEMENT PARTS LIST for correct part number. Since this Service Manual covers several models, use care to select the correct part for the model being serviced.

EXPLODED VIEW / VUE SUPERPOSE (2 / 3)

Note: Some parts may appear different than those shown in the exploded view. When ordering, refer to the REPLACEMENT PARTS LIST for correct part number. Since this Service Manual covers several models, use care to select the correct part for the model being serviced.

EXPLODED VIEW / VUE SUPERPOSE (3 / 3)

Note: Some parts may appear different than those shown in the exploded view. When ordering, refer to the REPLACEMENT PARTS LIST for correct part number. Since this Service Manual covers several models, use care to select the correct part for the model being serviced.

REPLACEMENT PARTS LIST / LISTE DE PIECES DE RECHARGE

PRODUCT SAFETY NOTE: Components marked with a  have special characteristics important to safety. Before replacing any of these components, read carefully, the PRODUCT SAFETY NOTICE of this Service Manual. Don't degrade the safety of the receiver through improper servicing.
