Safety Precautions

General Guide Lines

1. It is advisable to insert an isolation transformer in the AC supply before servicing a hot chassis.
2. When servicing, observe the original lead dress in the high voltage circuits. If a short circuit is found, replace all parts which have been overheated or damaged by the short circuit.
3. After servicing, see that all the protective devices such as insulation barriers, insulation papers, shields and isolation R-C combinations are correctly installed.
4. When the receiver is not being used for a long period of time, unplug the power cord from the AC outlet.
5. Potentials as high as 32 kV are present when this receiver is in operation. Operation of the receiver without the rear cover involves the danger of a shock hazard from the receiver power supply. Servicing should not be attempted by anyone who is not familiar with the precautions necessary when working on high voltage equipment. Always discharge the anode of the picture to the chassis before handling the tube.
6. After servicing make the following leakage current checks to prevent the customer from being exposed to shock hazards.

Leakage Current Cold Check

1. Unplug the AC cord and connect a jumper between the two prongs of the plug.
2. Turn on the receiver's power switch.
3. Measure the resistance value with an ohmmeter, between the jumpered AC plug and each exposed metallic cabinet part on the receiver, such as screw heads, aerials, connectors, control shafts etc. When the exposed metallic part has a return path to the chassis the reading should be between 4M ohm and 20M ohm. When the exposed metal does not have a return path to the chassis the reading must be infinite.

Leakage Current Hot Check

1. Plug the AC cord directly into the AC outlet. Do not use an isolation transformer for this check.
2. Connect a 2k ohm 10W resistor in series with an exposed metallic part on the receiver and an earth such as a water pipe.
3. Use an AC voltmeter with high impedance to measure the potential across the resistor.

4. Check each exposed Metallic part and check the voltage at each point.
5. Reverse the AC plug at the outlet and repeat each of the above measurements.
6. The potential at any point should not exceed 1.4 Vrms. In case a measurement is outside the limits specified, there is a possibility of a shock hazard, and the receiver should be repaired and rechecked before it is returned to the customer.

HOT CHECK CIRCUIT

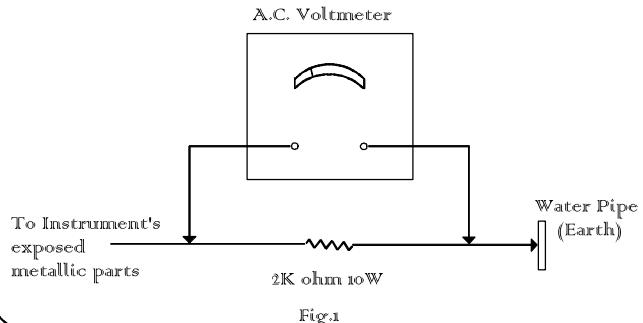

Fig.1

X-Radiation Warning

1. The potential sources of X-Radiation in TV sets are the high voltage section and the picture tube.
 2. When using a picture tube test jig for service ensure that the jig is capable of handling 32kV without causing X-Radiation.
- NOTE :** It is important to use an accurate periodically calibrated high voltage meter
1. Set the brightness to minimum.
 2. Measure the high voltage. The meter should indicate 31kV $\pm 1\text{kV}$ at zero beam current if the meter indication is out of tolerance, immediate service and correction is required to prevent the possibility of premature component failure.
 3. To prevent an X-Radiation possibility, it is essential to use the specified tube.

How to Remove the Control Panel (M-board)

1. Remove the E-board from the cabinet with the M-board attached.
2. Unclip by lifting the front of the M-board vertically.
3. After servicing ensure all wiring is returned to its original position before returning the receiver to the customer.

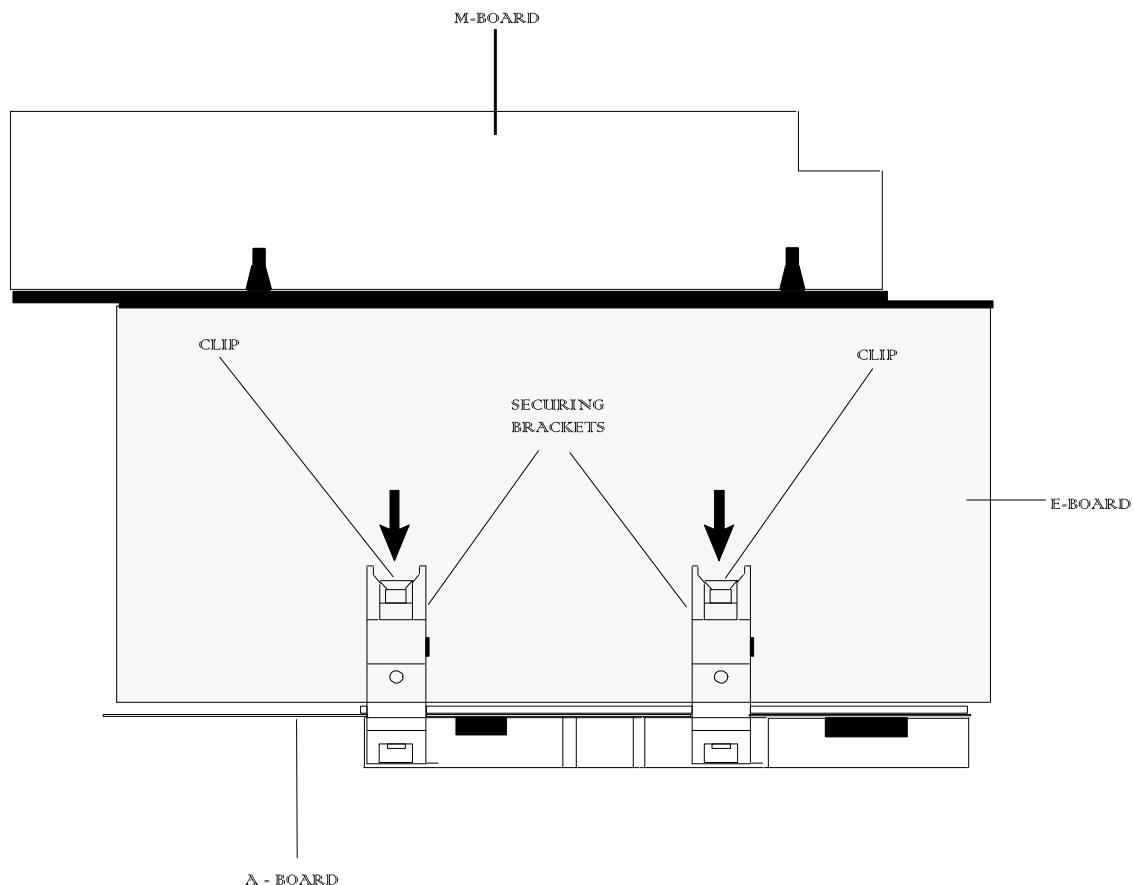

Fig.5

How to Remove the A - Board

1. Disconnect the four leads from the A - board.
2. Release the A board securing brackets by pushing the clips in the direction shown in Fig.5, and remove the A - board by gently lifting vertically.
3. After servicing ensure all wiring is returned to its original position before returning the receiver to the customer.

How to move the chassis into the Service position

1. Hold and lift the rear of the E- PCB chassis as shown in fig.6. and gently pull the chassis toward you.
2. Release the respective wiring clips and turn the chassis through 90°, anti-clockwise, as shown in fig.7.
3. Clip the chassis onto the support bracket as shown in fig.7 and fig.8.
4. After servicing ensure all wiring is returned to its original position before returning the receiver to the customer.

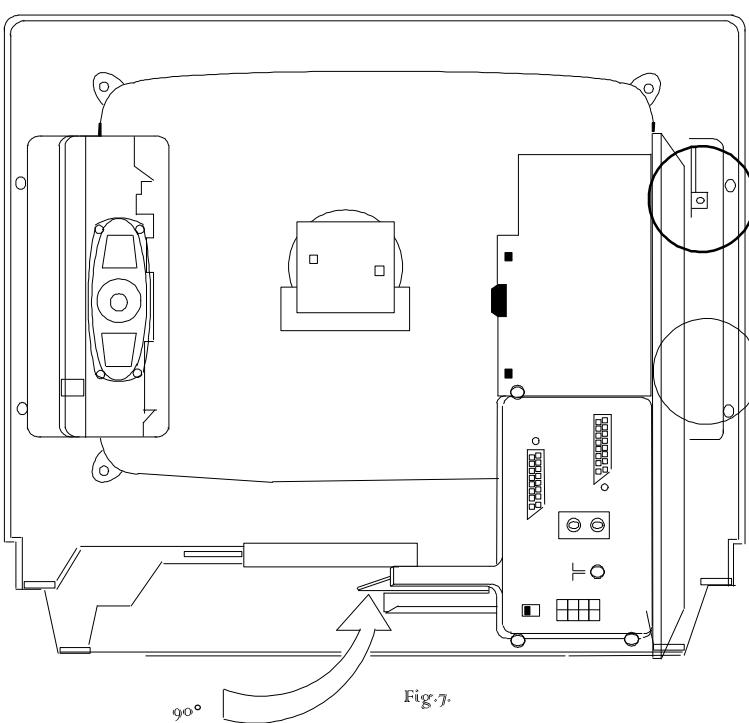

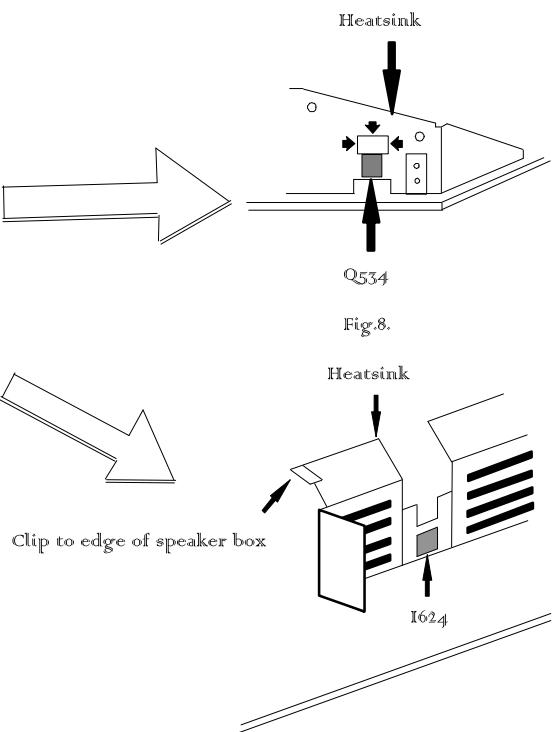

Fig.7.

Service position for the A-Board

1. Remove the A-board from the main chassis (E-board), see fig. 5, ensuring all leads are disconnected.
 2. Remove the two screws (A) (fig.9) from the plastic AV cover and unclip the AV cover from the A-board.
 3. Unclip the front metal cover (Fig10) and remove from the A-board.
 4. For ease of servicing remove the rear metal cover by desoldering (Fig.11)
 5. Fit the extension leads to the A-board making sure that the A-board does not touch the E-board (fig.12).
 6. After servicing ensure all wiring is returned to its original position before returning the receiver to the customer.

8. This schematic diagram is the latest at the time of printing and is subject to change without notice.

Precautions

- a. Do not touch the hot part, or the hot and cold parts at the same time, as you are liable to a shock hazard.
- b. Do not short-circuit the hot and cold circuits as electrical components may be damaged.
- c. Do not connect an instrument, such as an oscilloscope, to the hot and cold circuits simultaneously, as this may cause fuse failure.
Connect the earth of the instruments to the earth connection of the circuit being measured.
- d. Make sure to disconnect the power plug before removing the chassis.

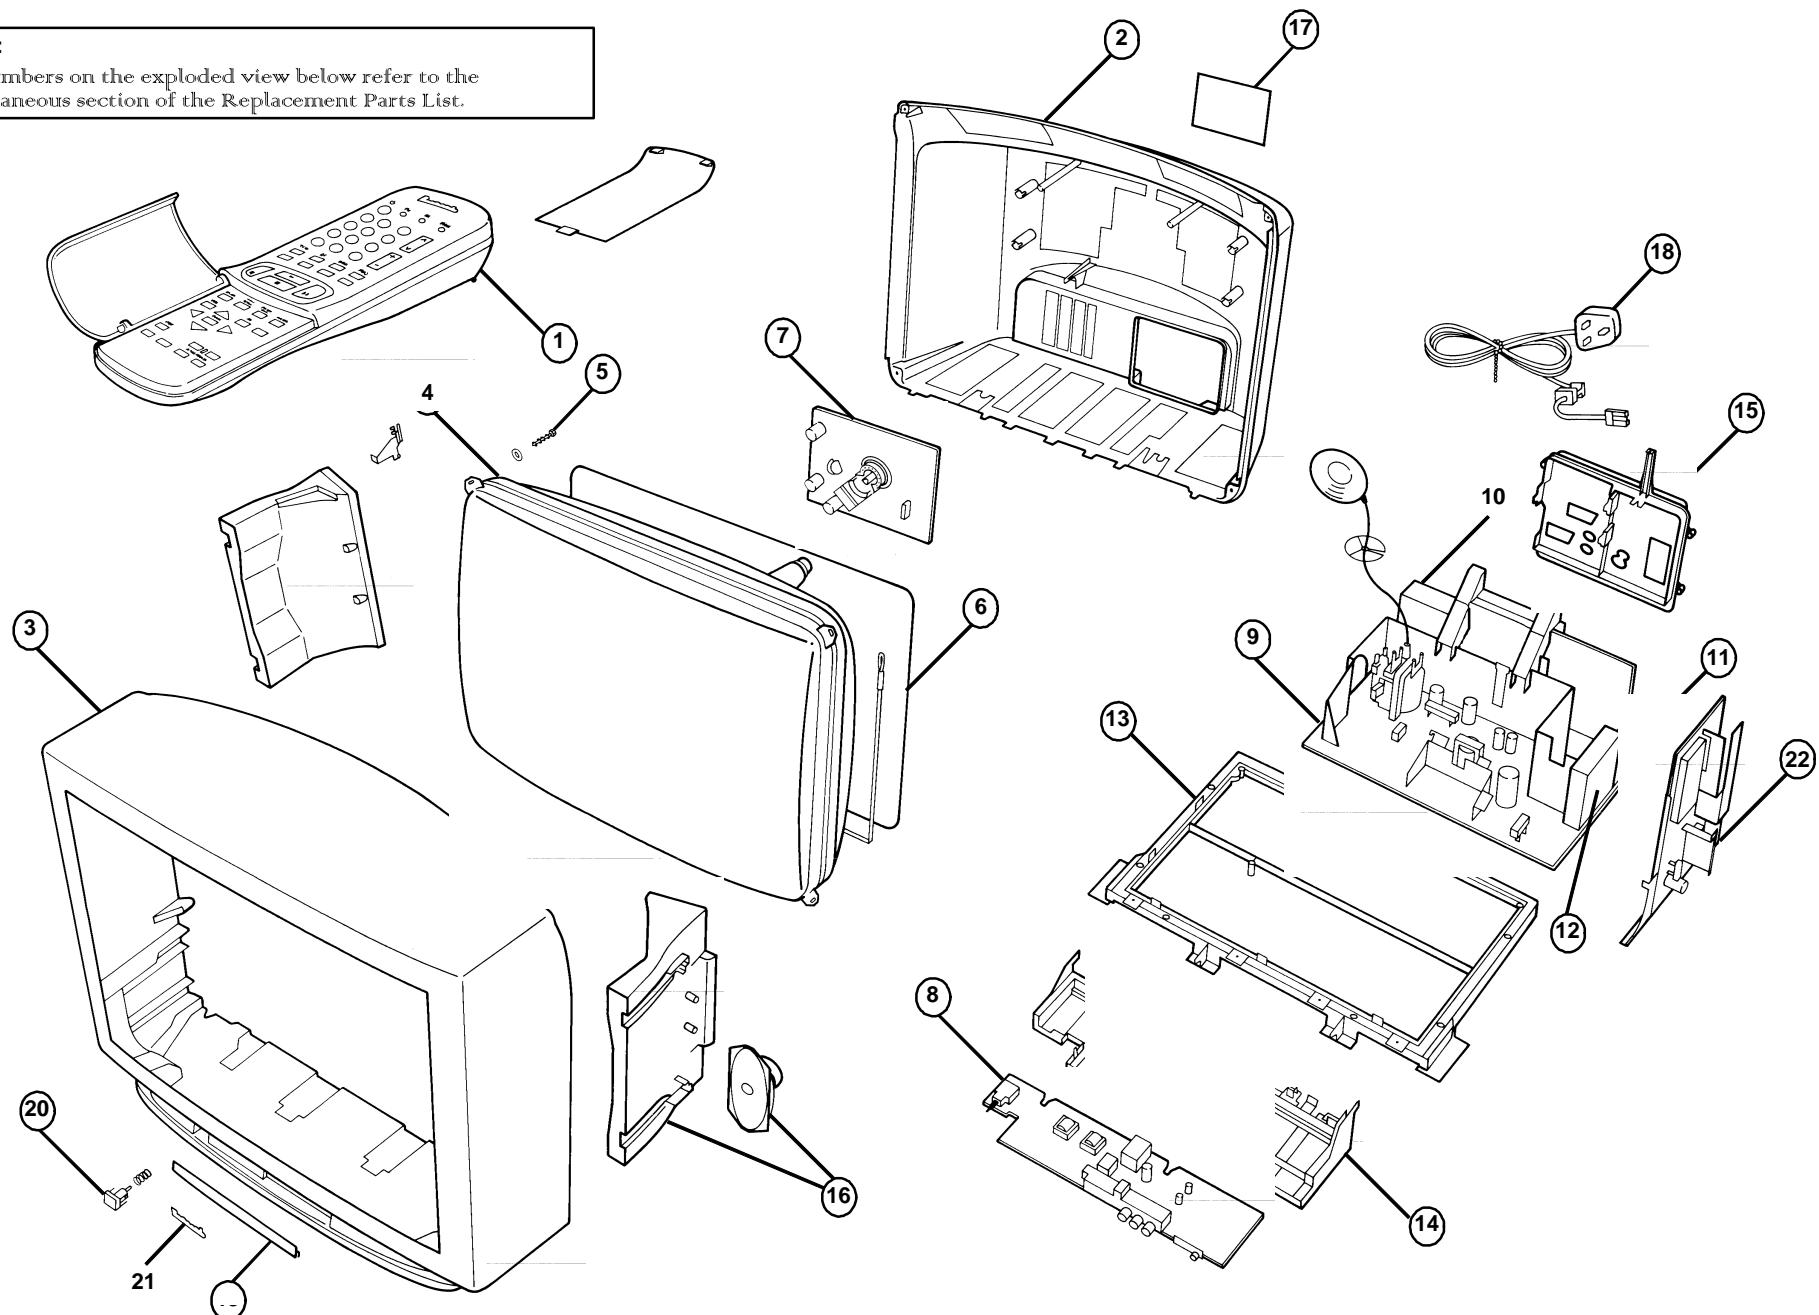

Remarks

1. The Power Circuit contains a circuit area which uses a separate power supply to isolate the earth connection. The circuit is defined by HOT and COLD indications in the schematic diagram. All circuits, except the Power Circuit, are COLD.
