This monitor is provided with a high voltage hold down circuit for clearly indicating that voltage has increased in excess of a predetermined value. Comply with all notes described in this Service Manual regarding this hold down circuit when servicing, so that this hold down circuit may function correctly.

Service Warning

With minimum Brightness and Contrast the operation high voltage in this display is lower than 27KV.

If any component having influence on the high voltage is replaced, confirm that the high voltage with minimum Brightness and Contrast is lower than 27KV. To measure high voltage use a high impedance high-voltage meter. (SENSITIVE RESEARCH Model: ESH or Equivalent) Connect (-) to chassis earth and (+) to the CRT anode button. (See the following connection diagram Fig. 1).

NOTE:

- 1) Turn power switch off without fail before making the connection to the Anode button.
- 2) Before turn power switch ON, confirm the AC line voltage, set the "Voltage Selector".

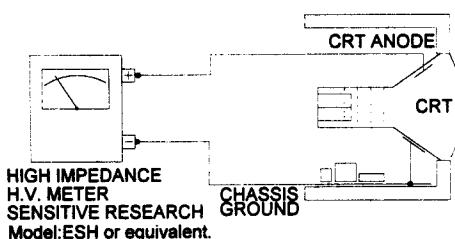

Fig. 1

X-radiation

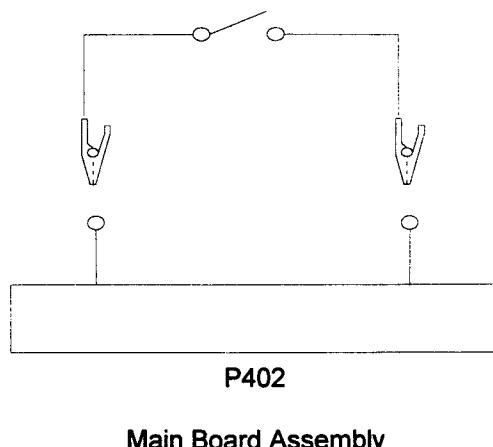

TUBE: The primary source of X-radiation in this monitor is the picture tube. The tube utilized in this chassis is specially constructed to limit X-radiation emissions. For continued X-radiation protection, the replacement tube must be the same type as the original, manufacturer approved type. When troubleshooting and making test measurements in a monitor with a problem of excessive high voltage, avoid being unnecessarily close to the picture tube and the high voltage components. Do not operate the chassis longer than is necessary to locate the cause of

excessive voltage.

CHECK OF HIGH VOLTAGE HOLD DOWN CIRCUIT

Checking of the high voltage hold down circuit operation.

1. Turn the switch of the unit ON.
2. Set Brightness, Contrast controls to max..
3. Short the two pins of P402 as shown in Fig. 2. The picture should disappear immediately.

P402

Main Board Assembly

Fig. 2

- 4.0 Turn the switch of the unit OFF.

PRODUCT SAFETY NOTICE

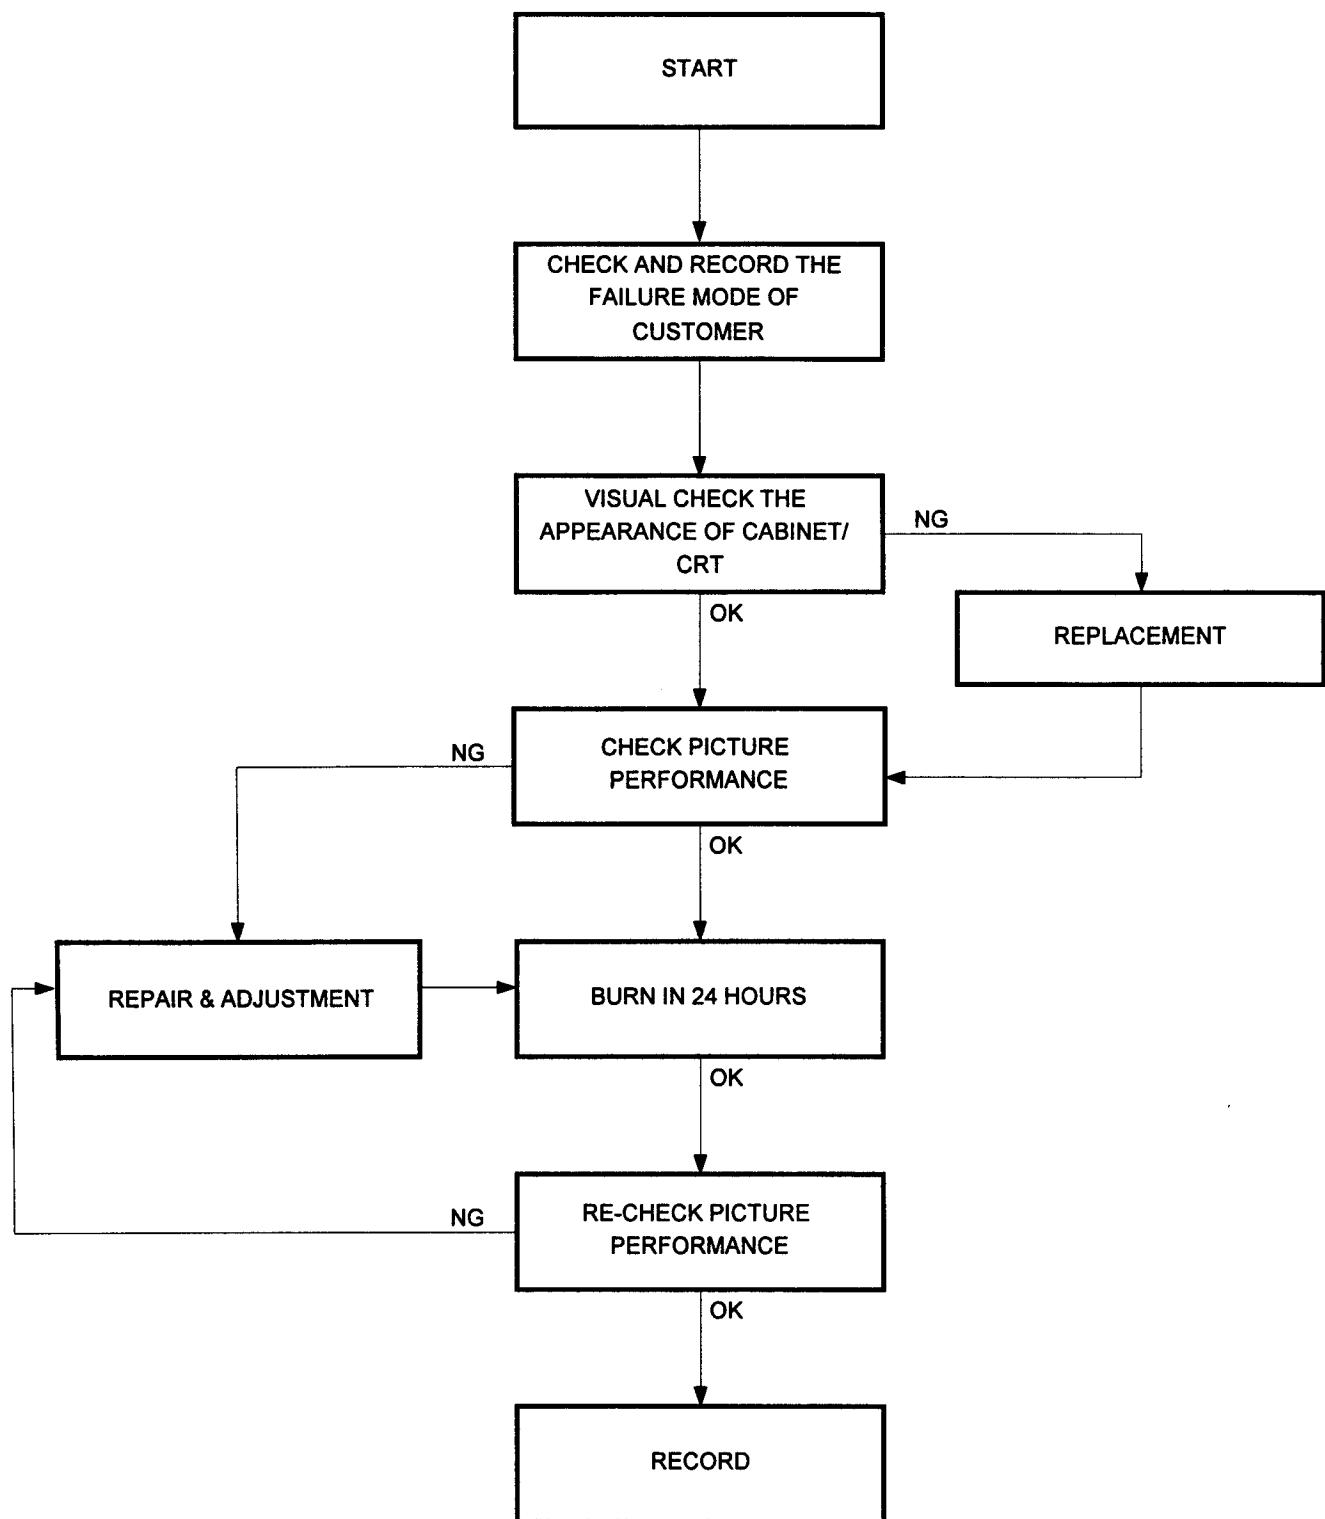

Many electrical and mechanical parts in the color monitor units have special safety related characteristics.

These are often not evident from visual inspection nor can the protection afforded by them necessarily be obtained by using replacement components rated for higher voltage, wattage, etc.. Replacement parts which have these special safety characteristics are identified in this Service Manual.

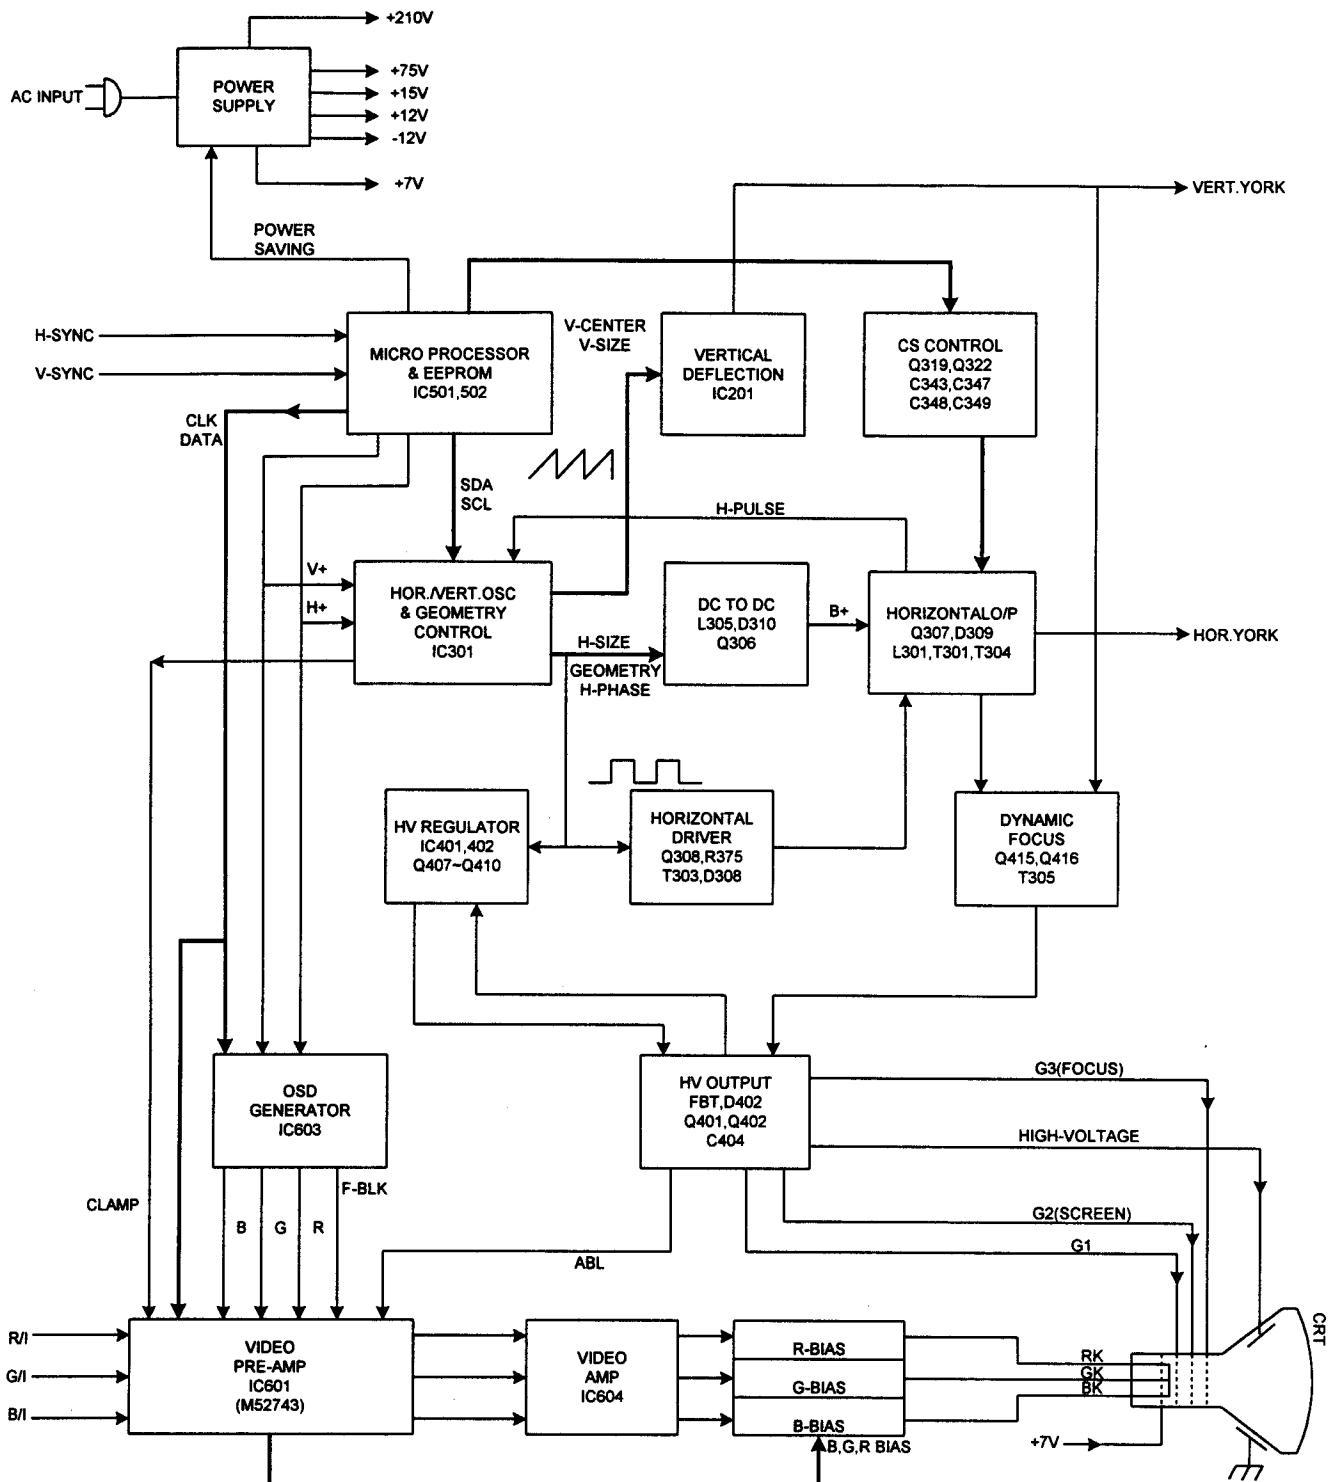

Electrical components having such features are identified by marking with "!" on the parts list in this Service Manual.

The use of a substitute replacement component which does not have the same safety characteristics as the manufacturer recommended replacement one, shown in the parts list in this Service Manual, may create shock, fire, X-radiation, or other hazards.

2.0 GENERAL MAINTENANCE PROCEDURE

3.0 FUNCTION BLOCK DIAGRAM

4.0 DESCRIPTION OF CIRCUIT

1. Power supply circuit

The power supply is a serial & universal AC input switching power supply. The start up circuit (Q101) will provide a DC voltage for PWM (Pulse Width Modulation) IC(IC101) when power on. While IC101 works normal, Q101 will be cut off by the DC voltage. The IC101 will Auto-detect output voltage of power supply from Pin2 and correct the duty cycle of Pin6 output pulse to compensate the variation of output voltage.

The output of IC101 Pin6 connected to power MOSFET to drive the power transformer T101. When power MOSFET is on, the energy stored in the primary winding of T101. Once MOSFET is off, the energy transfer to the secondary and charges the output capacitor to get the stable DC voltage.

2. Oscillation circuit

The functions H-size, H-phase, V-size, V-center, Side-pin, Parallel....are designed inside into IC301. The Pin2 is X-RAY protect input. When H.V output circuit is abnormal (H.V too high) the X-RAY protect circuit will shut off the horizontal output, H.V. also will be shut down. The Pin6 is B^+ control driver output. The Pin8 is horizontal square wave output drives horizontal output. The Pin11 is parabolic output. The Pin12,13 are vertical output. The Pin14 & pin15 are V-SYNC & H-SYNC input. The Pin17 is vertical blanking output. The Pin23,24 for vertical oscillator. The Pin28,29 for horizontal oscillator. The Pin30 is soft start.

3. Vertical output circuit

The Pin12 & 13 of IC301 are vertical sync output connected to IC201 (Amplifier), Pin5 of IC201 is vertical amplifier output drives the vertical deflection directly.

4. Horizontal output circuit

The DC-DC is to generate a DC voltage (B^+) for horizontal output circuit. The CPU(IC501) controls the H. size adjustment function of IC301 via the I²C Bus. The output of IC301 (Pin6) connected to gate of Q306 to make the Q306 switching. When Q306 is ON, the energy stored in L305 and the energy released via D310 when Q306 turned OFF. The B^+ applied to Horizontal Yoke and supply the power for horizontal deflection. The more the B^+ , will get the bigger horizontal size.

5. Micon circuit

The IC501(CPU) will detect polarity and frequency of input H.V. Sync.. The CPU will determine the mode of input timing (preset or users mode) and load mode data from IC502 (EEPROM). The output of IC501 were connected to other function circuit (ie. H-size, H-phase, V-size, V-center.....). Also, the user can adjust picture from key board and the data will be saved into IC502 automatically. For the O.S.D. mode, when O.S.D. manual is active CPU will inform the O.S.D IC (IC603) to send O.S.D BLK signal to blank the video signal from VGA card, and the O.S.D. IC will send O.S.D. R.G.B. Video signal to show the O.S.D. manual on screen.

6. H.V. regulation circuit

The IC402 is a P.W.M IC, Pin7 is P.W.M output which connected to output transistor Q401 and Q402 via buffer driver Q407,Q409,Q410,Q408. The Q402 is H.V. output switching transistor, Q401 and D402 are damper device provide the path of damper current. IC401 is a feedback amplifier, the feedback voltage from FBT Pin11 connected to IC401 Pin5, and output is from pin1 which connected to IC402 for P.W.M the duty cycle control.

7. Video output circuit

Video circuit consists of video preamplifier IC601 and output cascode amplifier IC604. IC601 is a video processing IC equipped with three DC amplifiers to pre-amplify R.G.B. signals from 0.7V to 4.2V.

The R.G.B. GAIN & BIAS control signal are from IC501 via I²C-bus to DAC IC601. The IC601 control to video gain. The output of IC601 (PIN 24,25,26) are connected to BIAS circuit of each R.G.B. signal's amplification and thus achieve a well balanceable white picture.

The O.S.D. R.G.B. (Pin 4,9,13 of IC601) is the input of O.S.D. Video signal. The IC604 is R.G.B. drive to capable of driving CRT.

7.5 DEFLECTION CIRCUIT TROUBLESHOOTING ROUTINE

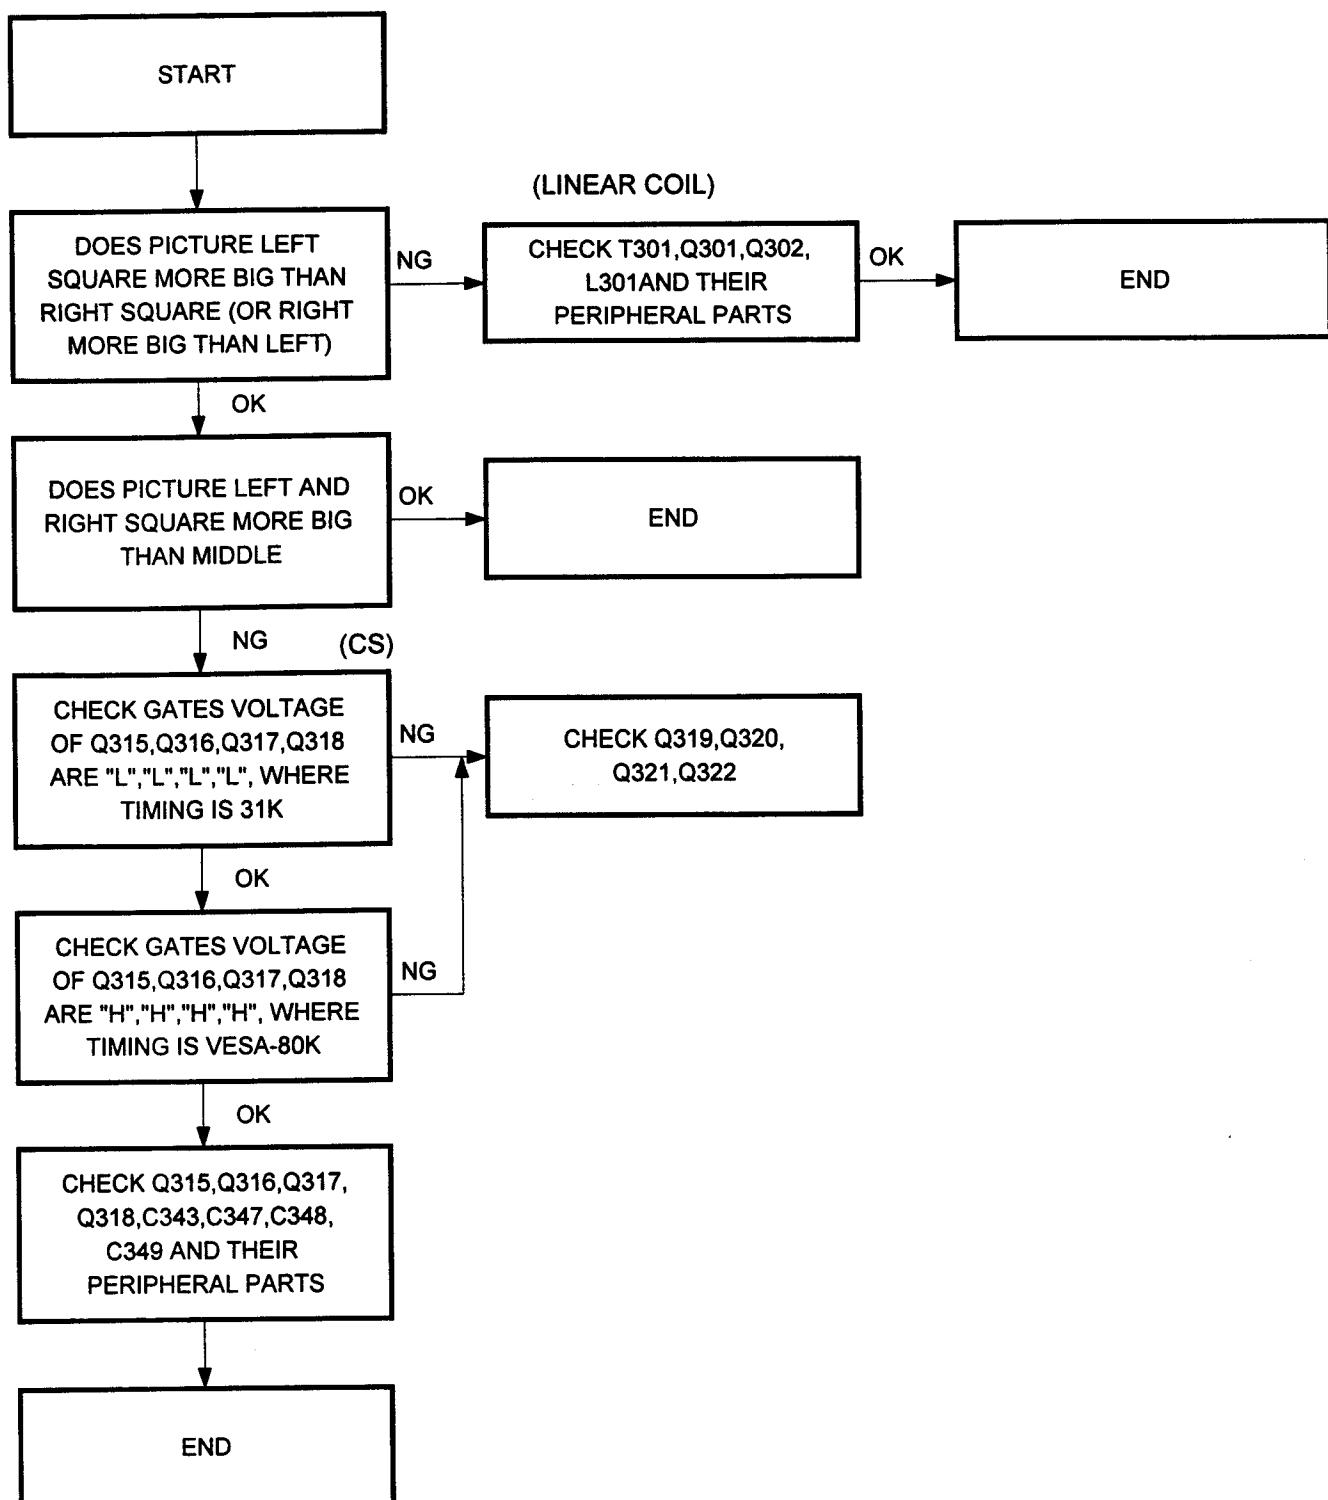

7.5.1 Horizontal Deflection Circuit

No Raster

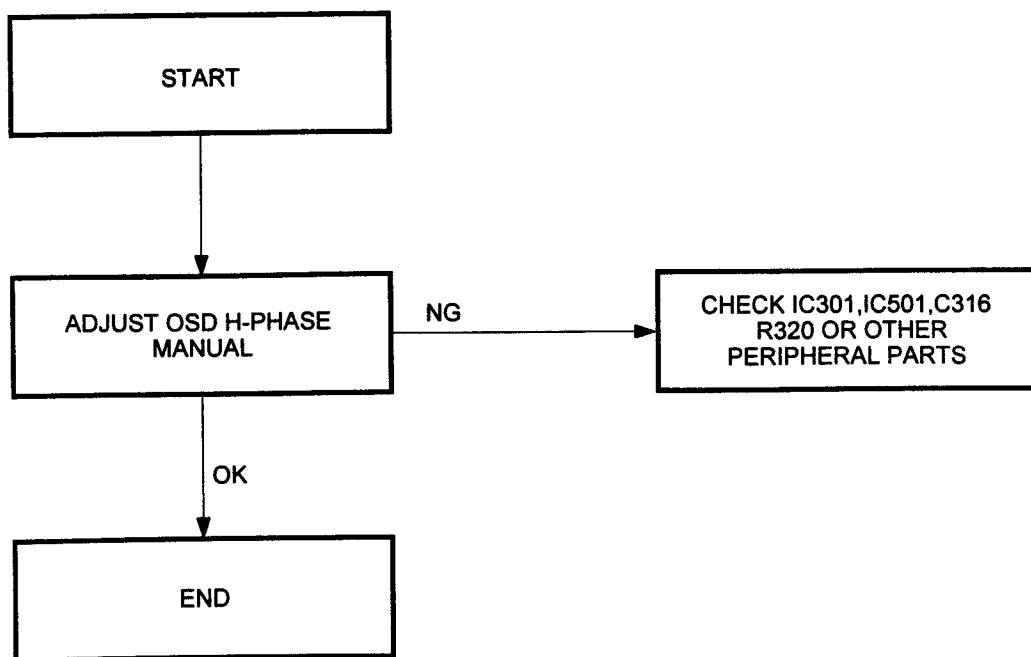

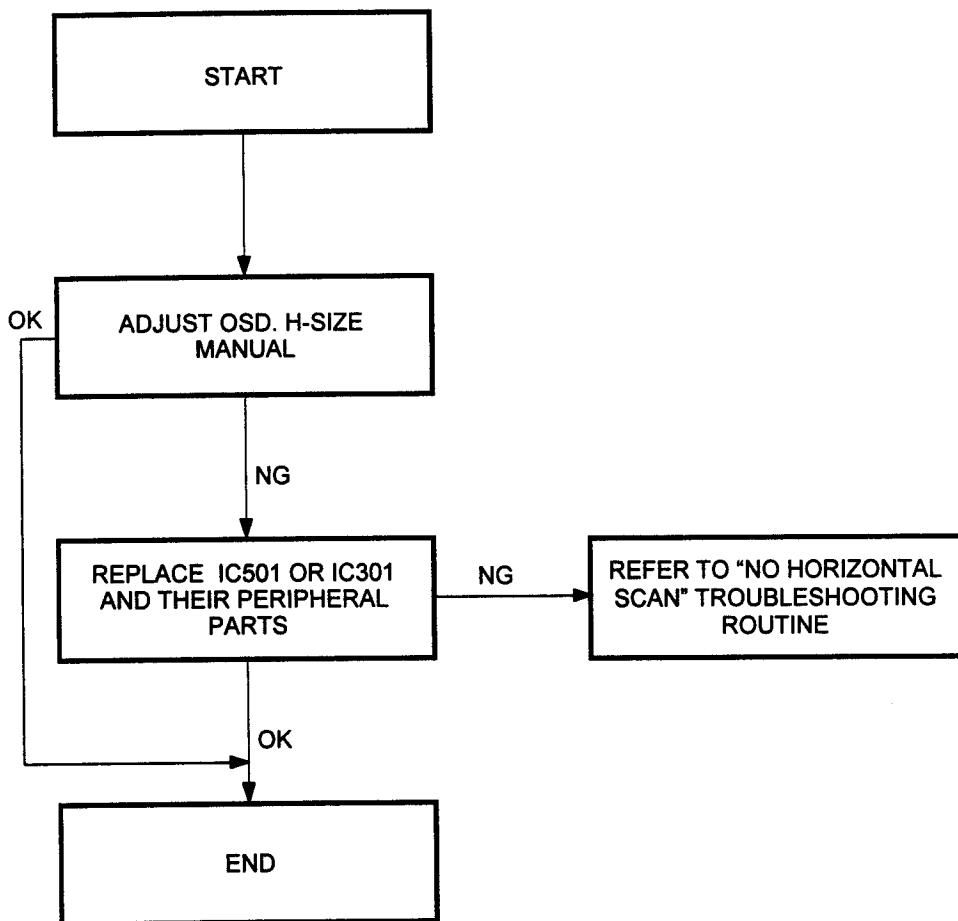

H-Asynchronous

No Horizontal Scan

Linearity

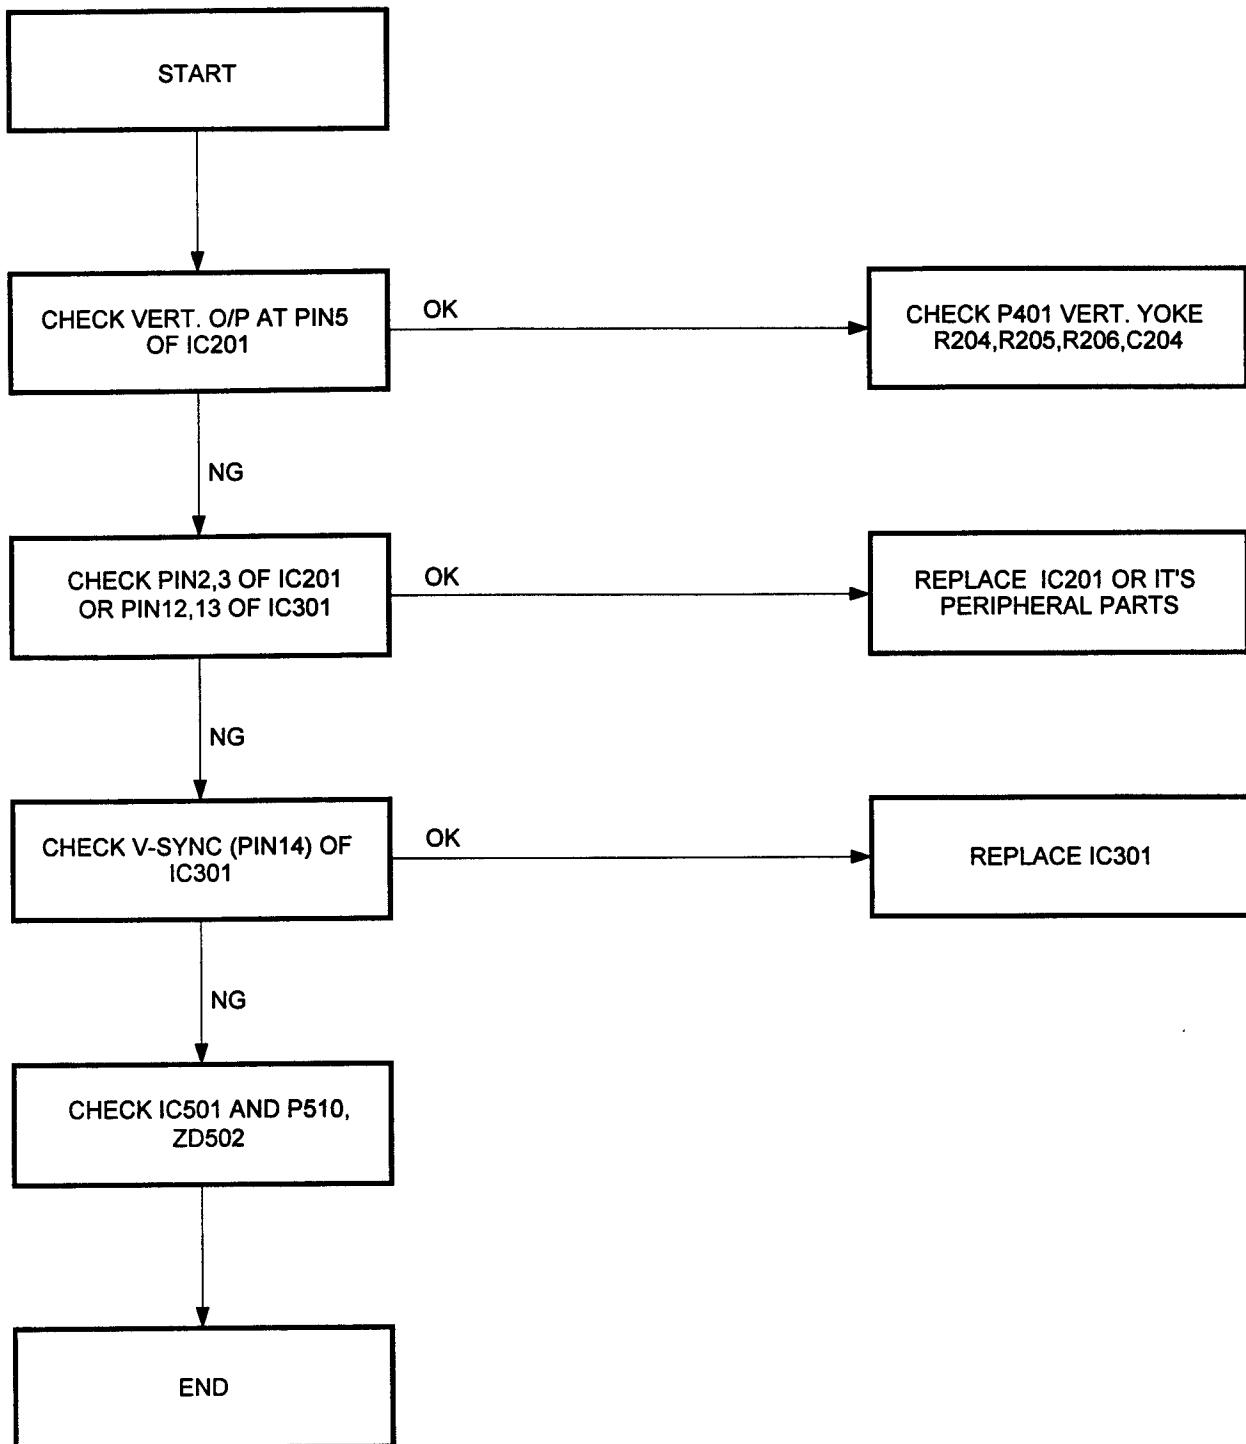

REMARK: 1. "L" means the voltage between gate and source is $< 4V$ which can't turn on the MOSFET.

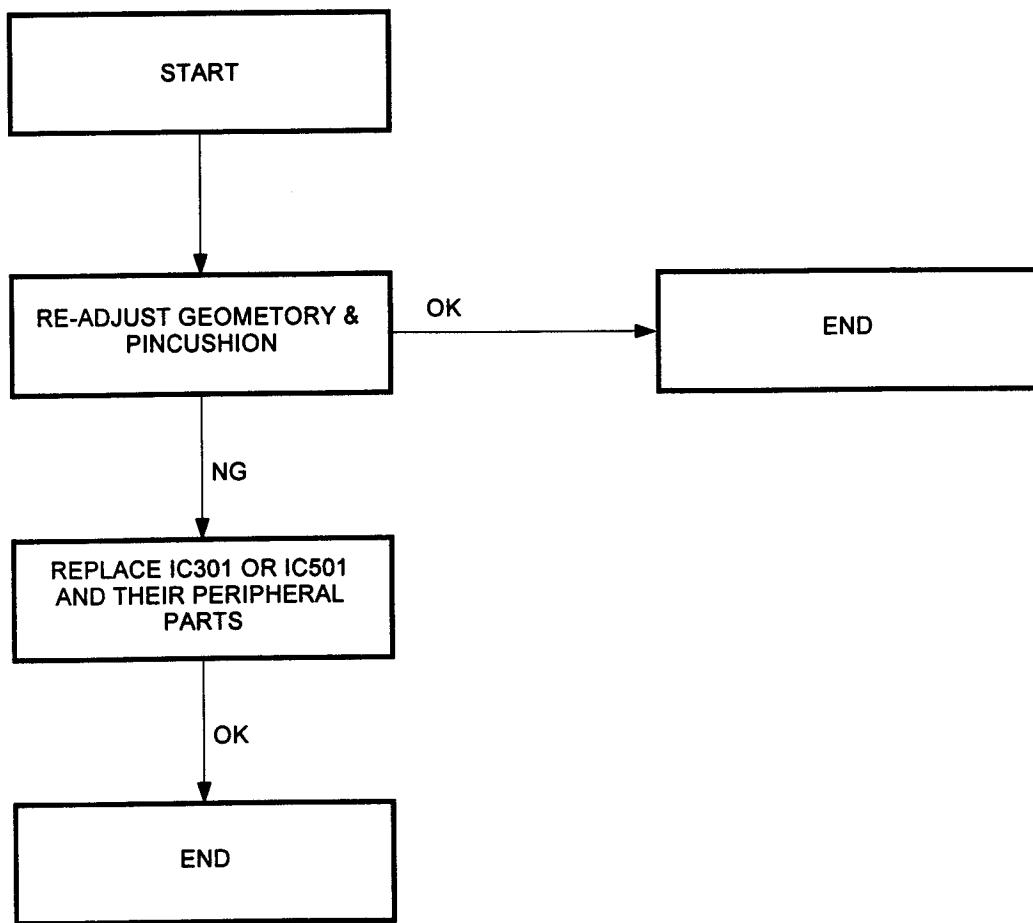

2. "H" means the voltage between gate and source is $\geq 4V$ which can turn on the MOSFET.

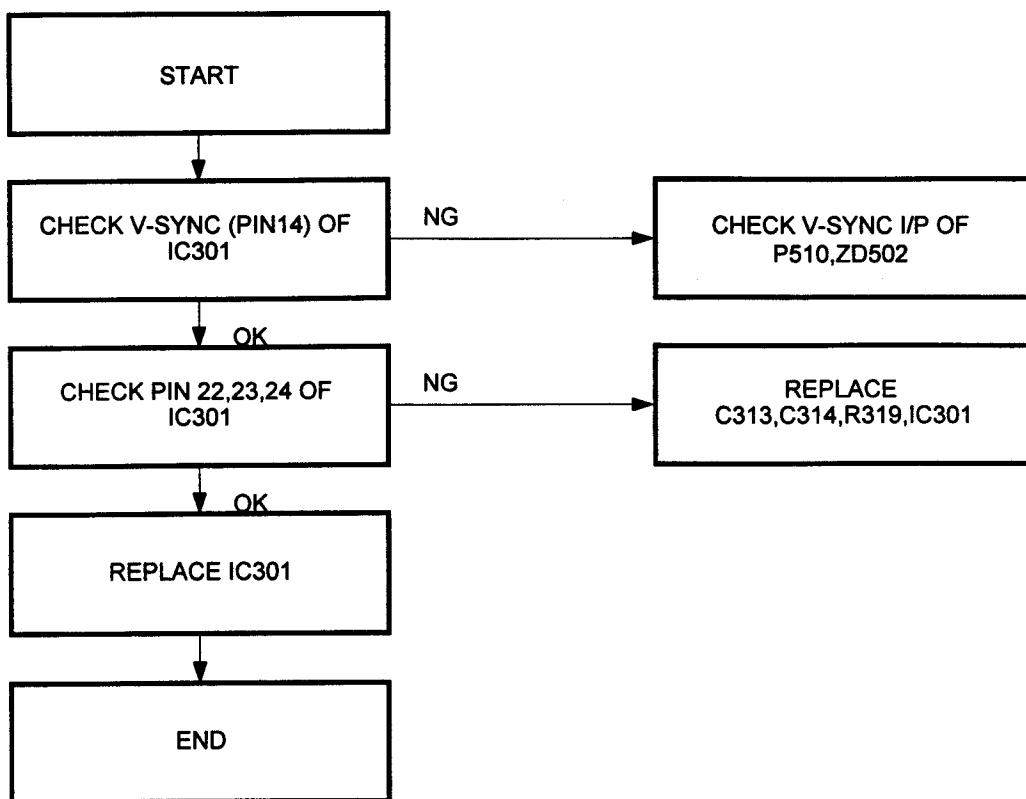

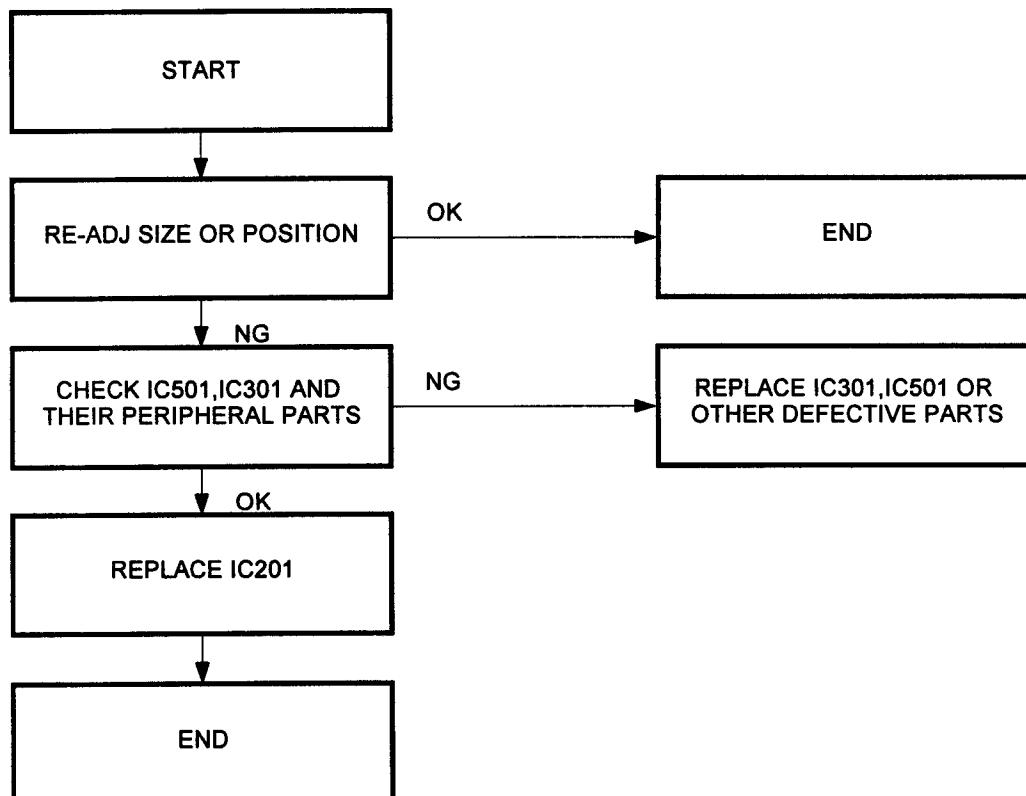

Out of phaseWidth Abnormal

7.5.2 Vertical Deflection Circuit

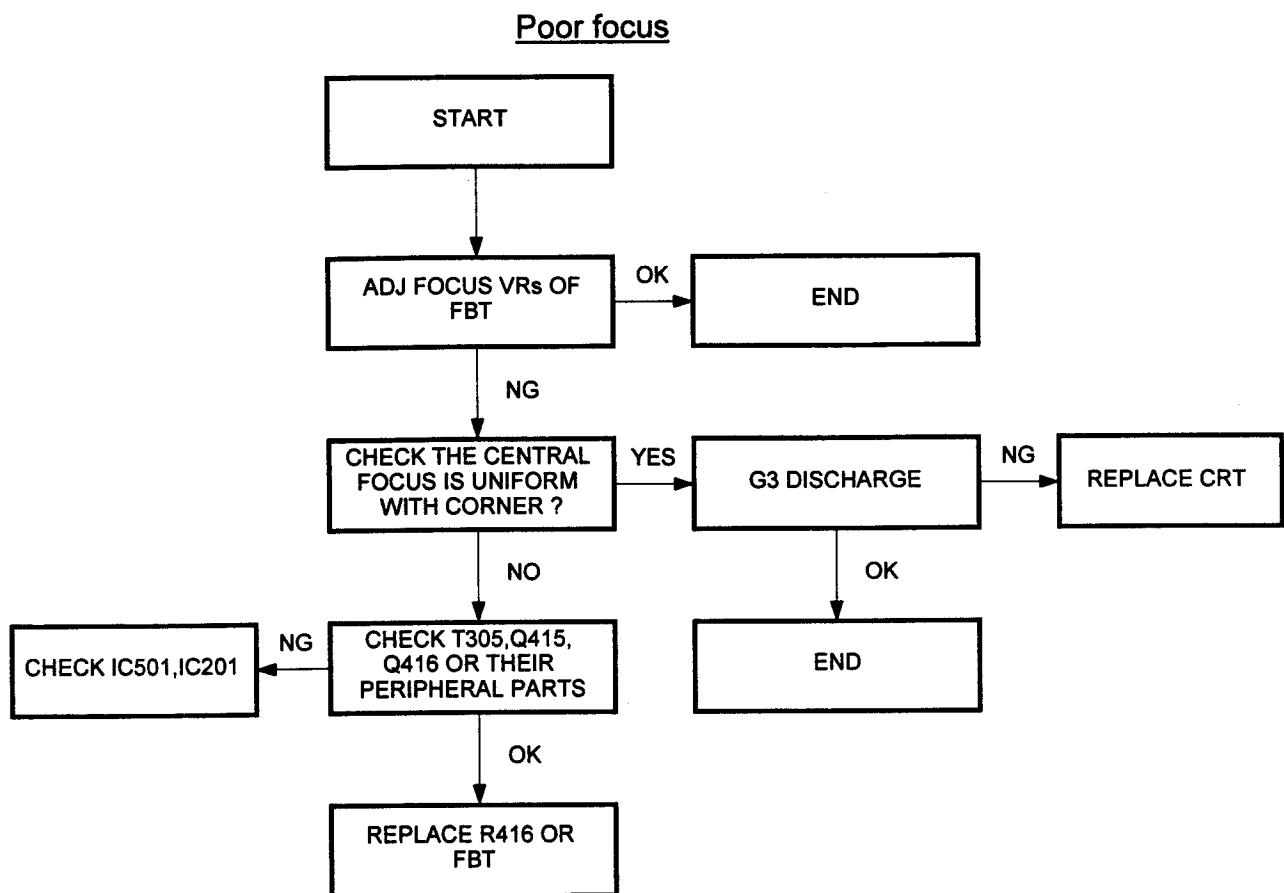

No vertical scan

Picture distortion

V-AsynchronousVertical position & Size

7.5.3 Other

TEST CONDITIONS: AC LINE IN:110V/60Hz
 PATTERN: CROSS HATCH
 STATUS : NORMAL

9.0 PARTS LIST

1795PF1 Parts List

Abbreviations :	Capacitors	EL: Electrolytic Aluminum, TA: Tantalum, CE: Ceramic PP: Polypropylene, PEI: Polyester (Inductive), PEN: Polyester (Non-Inductive) PPS: Serial Poly Propylene, MPE: Polyester Metalized, MPP: Polypropylene Metalized.
	Resistors	CF: Carbon Film, MF: Metal Film, VR: Variable Resistor. MOF: Metal Oxide Film, POT: Potentiometer
	Semiconductor	TR: Transistor, DI: Diode, ZD: Zener Diode, IC: IC.
Remark:		● : 1st priority , Recommended Q'ty = (Location Number x3) ◎ : 2nd priority, Recommended Q'ty = (Location Number x2) N : New parts ! : Critical Components Affecting X-radiation
